SOCIAL AND POLITICAL ORGANIZATION

Kinship terms identify parallel-cousins with siblings, and cross-cousins with potential or actual spouses. Cross-uncles and cross-aunts are called by the same terms as parents-in-law and grandparents; parallel-uncles and parallel-aunts are equated with parents. Similarly, parallel-nephews and parallel-nieces are classed with children, and cross-nephews and cross-nieces with children-in-law. Marriage is between cross-cousins or between the maternal uncle and his niece. Monogamy is the rule, but polygyny is the privilege of the chief and other important men. Polygyny is usually with several sisters (sororal) or with a woman and her daughters by a former union. The first wife runs the household, subsequent wives being assistants to the husband. The deficiency of available women which results from polygyny is compensated by homosexuality between adolescent male cross-cousins (Lévi-Strauss, 1943 a).

The village is ruled by a chief, but each of the nomadic bands into which it splits during the dry season is led by a secondary chief. Chief-

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

621 people are seldom met together, the average size of the bands being twenty individuals, women and children included. This demographic collapse cannot possibly have taken place without affecting the structure of the band. But here, too, we do not need to concern ourselves 121 with such questions as the type of political organization in earlier times. It is probably more difficult to understand Nambikuara sociology now than it was thirty years ago. Perhaps, on the contrary, the much reduced Nambikuara band offers, better than in the past, a privileged field for a study in social anthropology. My contention is that, precisely on account of its extreme impoverishment, Nambikuara political structure lays bare some basic functions which may remain hidden in more complex and elaborate systems of government.

[361] Each year, at the end of the rainy season, that is, in April or in early May, the semi-permanent dwellings laid in the vicinity of the 621 gallery-forest where the gardens are cleared and tilled, are abandoned and the population splits into several bands formed on a free choice basis. Each band includes from two to about ten families usually tied by kinship. This may be misleading when a band is met, for one easily gets the impression that it is formed as an extensive family. It 601 does not take long to discover, however, that the kinship tie between [602] two families belonging to separate bands may be as close, and eventually closer, than between two families inside the same band. The [582] Nambikuara have a simple kinship system based on cross-cousin marriage and the subsequent dichotomy between "cross" and "parallel" in every generation. Therefore, all the men in one generation are either "brothers" or "brothers-in-law," and men and women are to one another either siblings (true or classificatory) or spouses (true or classificatory). Similarly, children are, in relation to the adults, either sons and daughters (true or classificatory) or nephews and nieces, which is the same as actual or potential children-in-law.[1] As a result, there is no great choice of terms to express kinship, and this explains why kinship inside the band may appear closer than it actually is, and kinship between people belonging to different bands more remote than shown 602 by genealogies. Furthermore, a bilateral cross-cousin marriage system functioning in a relatively small tribe must produce a progressive 621 narrowing, and even a multiplication, of the kinship ties between any two individuals. This is a supplementary reason preventing family

[1] C. Lévi-Strauss. "The Social Use of Kinship Terms among Brasilian Indians." American Anthropologist, 45 (3) 1943.

621 Elótasu band. This is the custom among all the Eastern Nambicuara bands.

601 The kinship terminology belongs to the bifurcate merging type. The term *tayántasu* (grandfather) and the term *quatahdínisu* (grandmother) are extended to the brothers and sisters of one's grandparents. The term *awínisu* (father) and the term *ahakínisu* (mother) are extended to father's brother and mother's sister, respectively. Father's sister is termed *ahaínusu* and mother's brother *asúnusu*. A man calls his older brother *akandnusu*, his younger brother *daudídnisu*, and his sisters *auádnasu*, these terms being extended to parallel cousins. The terms for son (*akiráru*) and daughter (*akenéru*) are extended to the children of a man whom ego calls brother. The terms for sister's son and daughter are *asultu* and *asíntu*, respectively, these terms being extended to the children of anyone whom ego calls sister. The term for male cross cousin is *asúkisu* and that for female cross cousin, *dazésu*. There is just one term for grandchildren, *quatasdiserawa*.

The only affinal kinship terms which we could obtain were the terms wife (*azésu*) which bears a close relationship to female cross cousin; husband (*amezdisu*); and the terms for father-in-law (*asúnusu*), and mother-in-law (*ahaínusu*), which are identical to the terms for mother's brother and father's sister. Whether women employ different kinship terms was not ascertained owing to the fact that the women refused to discuss the matter and the male informants persisted in going to sleep when the subject was broached.

582 The kinship terminology supports the statement made by the Nambicuara that cross-cousin marriage is preferred. Excepting one Elótasu woman all the wives in Julio's band were Waklítisu and cross cousins of their husbands. At the death of
587 the husband the wife and children pass to the
768 deceased husband's brother. Women sometimes marry their mother's brothers. Residence is patri-
591 local although when marrying a woman from another band, the man sometimes remains with his wife's band for a while. Band membership, as has been stated, is determined by matrilineal descent.

622 The powers of the chief are limited to leadership in such activities as hunting, planting, trade, and ceremonies. Raids, although organized by the chief, are not led by him. The chief admon-

THE SOCIAL USE OF KINSHIP TERMS AMONG BRAZILIAN INDIANS

By CLAUDE LEVI STRAUSS

121 607 THE kinship system of the Nambikuara Indians of the Western Matto Grosso is one of the most simple in Brazil. At the same time it is typical of a sociological pattern, cross cousin marriage, which according to our present information seems to have been very common throughout South America. The object of this article is to compare the familial organization of the Nambikuara with that of other tribes described in the older literature and to show that a certain kinship tie, the brother-in-law relationship, once possessed a meaning among many South American tribes far transcending a simple expression of relationship. This significance, still observable in Nambikuara culture, is both sexual and politico-social; and, owing to its complexity, the brother-in-law relationship may perhaps be regarded as an actual institution. Since the sixteenth century travellers and sociologists have failed to devote sufficient attention to the phenomenon, probably because it could readily be interpreted as a development of the imported Iberian *compadre* relationship. In our opinion, on the contrary, the brother-in-law relationship, together with its remarkable implications, constitutes an indigenous aboriginal institution based on the pattern of native culture. Nevertheless, it presents a striking example of convergence in which the native and Latin-Mediterranean institutions show numerous apparent similarities overlying important structural differences.

131 133 The Nambikuara Indians are settled on the upper courses of the feeders of the Tapajoz River, between the eleventh and the fifteenth parallels. Their territory consists of a semi-desert savanna, which contrasts with the narrow gallery forests along the main waterways. The fertile soil of these forests allows [511] the natives to cultivate a few gardens in the rainy season, but during most of the year the Nambikuara subsist mainly by hunting and gathering wild food. 177 Compared to the majority of Brazilian tribes, their cultural level is low. As they were discovered only in 1907 and as they had practically no contact with white civilization between the year of the Rondon-Roosevelt Expedition in 1914 and the time of our own field work in 1938–39, their familial and social organization may be considered still intact.

601 The Nambikuara kinship system may be summarized as follows: All the father's brothers are classified together with the father and are called "father," and all the mother's sisters are classified with the mother and are called "mother." The father's sisters and the mother's brothers are classified together with the spouse's parents and the parents' parents in a single category which denotes simultaneously the cross aunts and cross uncles, the mother-in-law and father-in-law, and the grandparents. Passing to Ego's generation, the parallel cousins, both the children of the father's brothers and of the mother's sisters, are merged with siblings and are called "brother" and "sister," Turn-

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

ing to the children of the father's sisters and of the mother's brothers, a man calls all his female cross cousins (to one of whom he is or will be married) "wife," and all his male cross cousins "brother-in-law;" conversely, a woman calls all her male cross cousins (among whom her actual or potential husband is numbered) "husband" and all her female cross cousins "sister-in-law." No terminological difference is made between actual and potential spouses. The members of the next younger generation are similarly divided into "sons" and "daughters" (Ego's own children and parallel nephews and nieces) and "sons-in-law" and "daughters-in-law" (Ego's cross nephews and nieces), since these are or may be the spouses of his children.

The system is somewhat complicated by secondary distinctions made between elder and younger siblings and by the fact that another kind of marriage ——between a maternal uncle and his niece—is also practised. This new pattern usually appears in the polygynous unions which, in the prevailingly monogamous Nambikuara society, are the privilege of the chief. This point needs some elaboration. Nambikuara polygyny results from the fact that, subsequent to a first marriage having all the characteristics of the common (i.e., the cross cousin) form, a man may contract one or more unions of somewhat different nature. Actually, the position of his new wives is not the same as that of his original one, and, although constituting real marriages, the later unions are nevertheless psychologically and economically different from the first. The atmosphere in which they evolve is less conjugal and more like a kind of amorous friendship. The younger wives cooperate more extensively in the numerous tasks imposed on their husband because of his special social obligations. Furthermore, the activities of these women do not conform as closely as those of the first wife to the general pattern of the sexual division of labor. Finally, they are younger and are classified, in relation to the earlier wife, as "daughters" or "nieces." Such "oblique" unions (that is, between members of different generations) may also take place in monogamous marriages, but less frequently. Although their occurrence among the Nambikuara is an important point in our demonstration, the consequent modifications of the kinship system are not essential for the purposes of this article and we may therefore omit further mention of them. Our present observations will be limited to the special implications of the brother-in-law relationship which is expressed through the reciprocal terms *asúkosu* (Eastern dialect), *tarúiç* (Central and Western dialect) or *iópa* (Northern dialect).

It must be emphasized immediately that this useful translation of the native term is not in any way accurate. While the *asúkosu* is a man's male cross cousin and also his potential brother-in-law, since the persons calling each other *asúkosu* (or *tarúiç* or *iópa*) call each other's sisters "wife," it is only in particular instances that one or more of the individuals involved is, in fact, the wife's brother or the sister's husband or both. The meaning of the term *asúkosu*

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

is consequently much wider than "brother-in-law" as we understand it, including as it does approximately half the masculine members of a man's generation; the rest, of course, receive the name "brother" (consanguineous or classificatory). It should be noted that in the Nambikuara kinship system men alone have brothers-in-law and, conversely, women alone have sisters-in-law.

Only in the case of brothers-in-law are the Nambikuara conscious of a link between a special type of behavior and the position occupied by a kinsman in the relationship system. Generally speaking, there are no rules of avoidance or of privileged familiarity between particular kinds of relatives. The relations with the spouse's parents do not differ substantially from those with the parallel uncle and aunt and, although it is true that relations between consanguineous or classificatory siblings are rather reserved, the natives are unable to define this diffuse behavior. As a matter of fact, while siblings and parallel cousins do not avoid each other, they do not joke or even talk together unless there is a special reason for doing so. Sisters-in-law, on the contrary, comport themselves very freely. They laugh and joke together and render each other small services, such as rubbing each other's back with urucu paste. And, more especially, exceptional relations are revealed when one passes to the brothers-in-law.

We have already mentioned the partial polygyny which exists in the group. The chief or shaman periodically withdraws several of the youngest and prettiest women from the regular cycle of marriages; consequently, young men often find it difficult to marry, at least during adolescence, since no potential spouse is available. The resulting problem is solved in Nambikuara society by homosexual relations, which receive the rather poetical name *tamindige ki'dndige*—"sham love." Relations of this kind are frequent among young men and are more publicly displayed than heterosexual ones. Unlike most adults, the partners do not seek the isolation of the bush, but settle close to the camp fire in front of their amused neighbors. Although the source of occasional jokes, such relations are considered childish and no one pays much attention to them. We did not discover whether the partners aim at achieving complete sexual gratification or whether they limit themselves to such sentimental effusions and erotic behavior as most frequently characterize the relations between spouses. In any event, the point is that homosexual relations occur only between *male cross cousins*.

We never learned whether or not the same relations continue to exist between adult cross cousins; it does not seem likely. Nevertheless, the freedom and demonstrativeness displayed by brothers-in-law toward one another are not characteristic of the relations between brothers or between the members of any other class of relatives. One often sees among the Nambikuara (who, in fact, like to indulge in expressions of affection) two or three men, married and

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

lateral or the patrilateral cross cousin; nevertheless, the chosen interpretation stresses the male side in Nambikuara society, or, let us say, it shows a strong tendency in this direction. At the same time we can see in such a solution a specifically social structure beginning to superimpose itself on the formerly simple familial units.

We do not intend in any way to base a theory of the origin of dual organizations on these restricted observations, the character of which is mainly anecdotal. However, this is a case where "the characteristic features of the sib organization are in some measure prefigured among sibless tribes";[1] as a matter of fact, in order to fulfil the main requirements of a system of exogamic moieties, it would be sufficient for the new unit, once fixed, to retain the recollection of its dual origin by preserving the habit of not mingling the camp fires.

Moreover, the extension of the "brother-in-law" relationship provides an instance of the increasingly superior position of the men within the group, since it is through the men that group alliances are brought about, just as wars are waged by men.

The preceding observations have a further value, since with their help we may be able to interpret sociological information found in the older literature on South America, especially that dealing with the Tupi of the Brazilian coast.

There are striking similarities between several features of the Nambikuara kinship system and what may be inferred about the ancient familial organization of the coastal Tupi. When describing small details of Nambikuara daily life, one is often tempted to quote Jean de Léry or Yves d'Evreux, so accurately do their words apply to certain live features of Nambikuara society, notwithstanding the fact that they were written four centuries before this culture became known. As a matter of fact, several metaphysical themes are common to both cultures and, indeed, certain names in the Nambikuara religious vocabulary have a conspicuously Tupi origin. The most important similarities, however, are those involving the kinship systems. In both cultures the same three principles of familial organization are stressed and are apparently similarly expressed: First the dichotomy of the parents' brothers and sisters between parallel uncles and aunts, called "fathers" and "mothers," and cross uncles and aunts, called "fathers-in-law" and "mothers-in-law;" secondly, the marriage of cross cousins with the correlative assimilation of parallel cousins to "brothers" and "sisters"; and, finally, the avuncular marriage, which, among the ancient Tupi, seems to have taken the form of a preferential union between the mother's brother and the sister's daughter.

An excellent text by Anchieta gives evidence of the occurrence of the first principle, as well as showing signs of the existence of the other two:

[1] Robert H. Lowie, *Family and Sib* (American Anthropologist, Vol. 21), p. 28.

115 and only reveals her happy nature on occasions of songs and dances where
157 she excels. One always sees her occupied by some craft work which she seems to prefer—shaping or polishing disks of shells, drilling them through or filing them, rubbing earrings or bracelets. She talks little, letting herself be completely absorbed by her work. She is a wife and mother, and a remarkable informant for all details of the material culture.

a12. --Daughter of the preceding two, approximately 22 years; she is the wife of A73 who abandoned her to live with two women a74 and a75. Because of this, she returned to the charge of her parents, the more so because she is pregnant. She is placid, smiling and apathetic. She is separated from collective life by her condition
[164] and by a painful eye infection which struck her first among the members of her group of which several were later attacked by the epidemic.

A13. --About 40 years of age. Son of A18, "brother," consequently, of a2, "brother-in-law" of A1, whose older sister a14 he married. Always joyful, active and docile, he is the confidence man of A1, his preferred messenger, the companion he chooses for all complicated undertakings. He is industrious, a [44] not affected in his attitudes, and, as an informant, compliant, very verbose and not always clear or comprehensive.

a14. --About 40 to 45 years. Wife of the preceding, blood sister of A1, mother of A16. She is influential, active, diligent, at first quite rude, but in reality pleasing and competent. She exercises real authority over the other women of the group by her spirit of initiative and her pep. She is the grandmother of a8 and of a9 whom she feeds and whom she cares for frequently. Not only is she a good informant, but she sometimes takes didactic initiative. She loves songs and dances.

[608] A15. --About 15 years. He is an orphan; his father was the brother of A13 who took him in. A gentle, tranquil, rather timid boy.

A16. --7 or 8 years; son of A13 and of a14, "husband" of a5. He is a lively and curious child; his mother rarely refuses him anything, and he tyrannizes her willingly. She is very proud of him and overlooks many of his whims. One day she came to ask us to teach him to read. The attempts are not very encouraging. He looks upon the lessons as a game and refuses to learn the letters as determined forms; for him they are interchangeable, and he attributes to them in turn all the sounds which he has in his vocabulary.

115 A17. --Between 50 and 55 years, he is the dean of the group; he
157 is conscious of this and gets a certain pride from having around him
● 602 only "sons" or "daughters," "sons-in-law" and "daughters-in-law,"

115 grandchildren and great-grandchildren. He is physically robust,
157 amiable, happy and talkative; very much inclined toward erotic
602 jokes. He gives information willingly, with an extreme good will and a tireless volubility. But his explanations are not always clear, and it is necessary to let oneself be guided by his slightly incoherent fantasy.

115 a18. --About 45 years; wife of the preceding, mother of a2 and
157 a22. She is a serious woman, industrious, devoted to her husband and children. She laughs little, talks to herself, and is always busy with some task. Her bits of information are rare, but solid.

a19. --About 10 years. Daughter of the two preceding. She is a very pretty girl, still a child who yet scarcely shows the first signs of puberty. She has in the group a position as "mother," as does her little sister a20. She is a brutal and sometimes violent child, who adopted towards us an attitude confined to hostility. Her language is crude and she gets involved willingly in the most daring pranks. This attitude is at least partially explained, as will be seen farther on, by her age situation.

[45] a20. --Little girl of 5 or 6 years, sister of the preceding: her contemporaries and even some adults call her "mother." She is perfectly insufferable; pretentious, affected, continually greedy for presents or distractions.

A21, a22, a23. --It is difficult to characterize these three individuals who lived, during nearly the whole time of our visit, in an almost absolute state of silent segregation. The baby a23 is not yet weaned, and the state of couvade was to end at the end of our stay. We shall describe later on the operations which sanction return to communal life. A21, 35 to 40 years, is the brother of A1; a22, about 18 years, the sister of a2. A21 was to die by drowning during one of our absences. The baby is 12 to 18 months old.

621 As we have said before, the restricted group such as it has just been described, is temporarily united with other similar bands, or is temporarily swelled by other family groups. Thus to the 6 "fires"(1)

602 1. As the following analysis shows, the family group—that is the restricted group—of the Nambikwara is rather difficult to define. The empiric notion of the hearth seems to us the most clear and practical. It defines the grouping of the individuals who come together in the evening and sleep around the same fire. In group a1 (restricted) studied previously, there are

602 from this point of view, six fires, namely: I (1 to 5); II (6 to 9); III (10 to 12); IV (13 to 16); V (17 to 20); VI (21 to 23).

621 comprising the stable group are added intermittently:

Fire 7 (24 to 28). Five individuals, including: A24, "son" (of an elder brother) of A1 (20 to 25 years), husband of a25 (18 to 20 years), their baby a26 (about 2 years), the father A27 (about 50 years) of a25, and the brother A28 (about 12 years) of the latter.

Fire 8 (29 to 37). --Eight individuals including: A32, chief of the group comprised of fires 7, 8 and 9. About 40 years of age, asukosu of A1; his five wives, a33, a34, a35, a36, "sisters" of each other (18 to 25 years), and their "mother" a37 (about 40 years), besides the 3 children of this latter, a30 and A31 (8 to 11 years) and a29 (about 2 years).

Fire 9 (39 to 41). --Four individuals, that is, two households, whose kinship relationships are obscure. A38 (about 50), "brother" of a2, and his wife a39 (about 45), "sister" of A1; and A40 (about 30), "brother" of A1, and his wife a41 (about 30), "sister" of a2, the two latter "father" and "mother" of a5.

Fire 10 (42 to 47). -- Six persons, including: A42 (about 30 years old), asukosu of A1; his two wives, the one a43 (about 35 years old), "sister" of A1, and the other a44 (about 18 years old), "niece" of A1, and three children, A45 and A46 (9 to 12) and a47 (2 to 3 years).

[46] Fire 11 (48 to 50). --Three individuals: A48, "brother" of A1 and "husband" of a2 (about 35 years old), his wife a49 (about 35 years old), "wife" of A1 and "sister" of a2. They are consequently "father" and "mother" of a5, and their child a50 is her "sister" (3 to 4 years old).

Fire 12 (51 to 56). --Six persons: A51 (about 40 years old), "brother" of A1 and ajukedisu of a2, his wife a52, "sister" of a2 (about 40), and four children, a53 (14 years old) and A54, a55 and A56 (6 to 10 years old).

Fire 13 (57 to 61). --Five persons: A57 (about 45), brother of A69, and asukosu of A1, "older brother" of a2; his two wives, one a58, "sister" of A1, the other a59, his "daughter" (20 to 30 years old), and two children, A60 and A61 (3 and 7 years old), both "husbands" of a5.

Fire 14 (62 to 66). --Five persons: A62 (about 42 years old), asukosu of a1 and akenshosu of a2, his wife a63, "sister" of A1 and of a58, and mother of a3 (about 40 years old), their child a64 (about 5)

462
[58] like the women, but from the shoulder (adiuisi'kitiu, al), and frequently lightening the load by dragging the strap in the left hand, which they explain by saying that they need to watch out for possible game. And they naturally do not neglect collecting and gleaning whenever the occasion is presented or necessity is felt. In like manner, the women normally aid their husbands (especially the polygamous wives) in their work in the gardens. Both sexes cut down wood, the men for constructing huts or shelters and for making bows, arrows, spears and clubs, etc., and the women, more often, for the fire wood. Above all, and when she is not occupied by her own work, the woman aids her husband in all the tasks that are his. She holds his implements, gives them to him when he asks for them, supports the end of the arrow or the wood of the bow while he repairs or polishes them, or begins to twist the cord while he finishes the wooden part. She does the retouching and finishes the work. This frequent and always harmonious collaboration gives the impression that the sexual division of labor is much less strict among the Nambikwara than it is commonly, and sometimes one might even think it non-existent. This is not so; but the rule is constantly made flexible or masked by the unity of the couple.

601 As we have shown in studying the kinship system all the classifi-
602 catory contemporaries of an individual belonging to a different sex are divided by him into husbands and wives, and brothers and sisters. We have found no term which designates the actual spouse, and allows one to distinguish him in conversation from the classifying spouse. A man calls his wife or wives, and his cross-cousins (fem.) indiscriminately asiesu, as the woman designates her husband and her cross-cousins (masc.) by the same term owinaesu. But, of course, behavior is very different in the two cases. It has just been seen to what extent relationships are close and active between true husband and wife. As regards his potential wives, a man does not adopt any particular attitude, and the relationships do not seem to be either [59] [Table: Sexual Division of Labor] more or less intimate than those which he carries on with his sisters (the same remark is true as regards the relationship of a woman with her potential husbands and her brothers). In these two cases, the relationships are characterized by [60] great reserve, the individuals involved do not pay much attention to one another and rarely address one another except for definite reasons. But it is a question here of a mass attitude, conditioned by usage, rather than of an over-all picture of conscious and stylized reactions. The Indians do not seem to perceive

[Text continues on p. 67]

601 The Indians do not seem to perceive
602 the specific nature of certain inter-individual relationships except in
[123] the case of relationships of stepmother and stepfather, as will be seen farther on. Nevertheless, the very great liberty which reigns between a man and his wife on one hand, and his brothers-in-law on the other, contrasts greatly with the more serious and dull character of his dealings with his sisters or his (theoretical) wives. This reserve goes to the point of forbidding the verbal expression of the relationship of potential spouses among the children to a certain degree. In the
[124] course of our interrogations, we have always found it difficult to obtain an answer from the interested parties themselves or from their close relatives when the relationship was that of husband and wife (1).

1. The Indian questioned answers that he "does not know" or changes the subject of conversation.

However, there was no case where the exact answer was not given after several evasive words, or an affectation of ignorance, or an attitude of ill will. But however slight the prohibition (the exact information seems to be considered rather as an impropritey or an
[125] indelicacy), it is no less odd because of it, since children classed as potential spouses behave often, and very openly, as such, without anyone objecting to it.

595 Several times we have alluded to polygamy, concrete examples
462 of which were analyzed on the occasion of the study of the kinship systems. Among the Nambikwara, polygamy represents a general tendency limited by the quantity of available women, and a prerogative existing among the chiefs of the groups, the shamans, or outstanding personalities. From this point of view, it springs from the study of command, and we shall return to this when this problem is tackled. Whenever it exists, polygamy is not a substitute for monogamous marriage, it is added to it without suppressing it. An individual begins by marrying one single woman, and upon the occasion of his social advancement, or of happy occasions, it is suitable for him to add some companions. But a very clear distinction, even though it is not sanctioned by the vocabulary of kinship (2), is

595
601 2. To characterize the functions of the first wife, an informant (A6) once used the term asiku atoyerelisu (a1); to designate the supplementary wives, another informant (B1) mentioned a form nukonatere, which could be a feminine of nukonatore (b1), "companion," a term which the chief uses to designate the men of his group. But the

855 863 8. ɯ̃ɾiɛkihĩndage numĩ sɛlɛlajene ɛlamnihĩ (bl)
The child has urinated! the hide! he is dirty! throw out(the urine)!

Later, when the child can isolate himself but not yet clean himself up, he is seen returning on all fours to his mother and remaining in that position while she applies the small twig in the way that has been previously described.

142 856 All children seem to have a pigmented blotch at birth to which no particular belief is attached. The informants only mention the phenomenon with that positive and detached attitude so striking on their part:

9. ɯ̃ĩtte ʔɛdɛʔɛdɛdnege ɯ̃ɔdaɾige kã kã kã ɯ̃ɛdɛrige (bl)
the children marked with green are born, one day, one day, one day, it disappears.

The disappearance of the blotch actually seems to be very rapid.

593 602 609 One should, naturally, distinguish true parentage and classificatory parentage. The child does not adopt any particular form of conduct towards his "fathers" and "mothers" in the classificatory sense of the word. He treats them like other adults of the group. Often, furthermore, an individual calls a boy or girl much younger than himself father or mother (thus a19 and a20 are "mothers" of A6 and A24).

[597] [601] When an orphan is taken in by a parallel uncle or aunt, the classificatory parents take the place of true parents, and consequently the conduct changes. In general, the Indians do not use [67] a term to distinguish classificatory parents and children from blood ones. When seeking precision, they add the word tawɛttu (a1), tawɛtte (b1): "my little one," to the term for son or daughter (aʔkiraru, aʔkineru), whose connotation seems thus to be social first of all. The physiological acceptance of this springs from the fact that the word is also used to designate the young of animals, other terms being reserved for relationships of parentage in the human family.

855 157 The Nambikwara feel very real affection for their children, and show it as regards them, and they are repaid in turn. But these sentiments, however real and profound they may be, are often masked behind the nervousness and instability so characteristic of indigenous conduct. Also, as the following example will show, the risk is to let oneself be fooled by apparent indifference, and even momentary rudeness.

Little A16 suffers from indigestion; he has a headache, vomits, passes half the time groaning and the other half sleeping. He is ill, (intikãtu, a1), but no one, parents included, pays the least attention,

603 611 On the other hand, grandparents behave toward their descendants so as to show the permanence of the filial line. a14 takes special care of her granddaughters (daughter's daughters), orphaned by the mother, a8 and a9. She feeds them, bathes them, and the baby spends her days near her, and often the nights. When the group travels, she is the one who carries her when she can no longer walk. But above all, when a piece of game has been brought in by a hunter, one sees in the choice of beneficiaries, outlined in the heart of the group, the limits of a unit greater than the conjugal family, and whose reality appears only rarely in daily circumstances.

224 602 Thus, when a boa sucuri (irftasu, a1: Eunectes murinus) has been brought in one day by A17, he gives the tripe to his daughter a19, who passes it on to her sister a22; the latter divides it between a12 and a5 (her "daughters") and reserves a portion for herself; at the same time A17 cuts the body into portions which he gives to A13, A1, A21, and of which he keeps part. Here, the division is almost coextensive with the restricted group. But, in more serious circumstances (1), the division of

1. P. 106 sq., cessation of menses (état de marge).

an irara (inihfnukilesu, a1; Mustela sp.) by A21 gives rise to the following distributions:

A quarter to a18 (wife's mother);
A quarter to a2 (wife's elder sister);
A quarter to a14 (brother's wife);
A foot to a19 (wife's younger sister);
A half-head to A17 (wife's mother's husband).

[75] He consumes the rest with his wife and baby, and the beneficiaries divide their share with spouse and children. Thus in the heart of the group there is outlined an even more restricted unit:

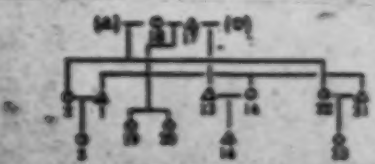

Fig. 17.

224 602 that of the members of a same bilateral family. Likewise, in the pounding of manioc, a2, a14, a18, a22 often work together and prepare a collective mass which will be divided among the same families, and will serve as food for the same persons as those represented in the above chart.

602 603 157 We do not know whether to attribute certain striking behavior of A17 to his classificatory position or to his individual characteristics. He is very clearly conscious of his almost patriarchal position in the midst of the group and of the fact that all the members, or almost all, are as regards him: asuittu, asuittu, tauéttu, tauéttu, tauéttu; he dwells on it, complacently enumerating the terms with grand gestures. He is gay, jovial and finds evident satisfaction in conversation about erotic subjects, contributions to which he enhances by mimicry and appropriate contortions. Within the group, in whose activities he shares only partially, he holds no authority, explicit or implicit.

RELATIVES AND ALLIED INDIVIDUALS OR COLLATERALS AND RELATIVES BY MARRIAGE

602 606 There is no apparent difference between the behavior of an individual as regards his spouse's parents and his behavior as regards his own parents. That is, from the point of view of individual relationships, the order of generations takes precedence over that of degrees. Parents-in-law, parents of the third degree, are concretely classed in the second generation ("fathers" and "mothers"). The same can be said for relationships of the wife's father and mother, or of the husband's, with the spouse of these latter. No special prohibition could be noted.

607 605 Sisters-in-law (aseétasu, a1; ndédere, b1) enjoy very free contacts among themselves. They laugh, joke together, do one another small services such as that of mutually rubbing the back with the tincture of urucu (Bixa orellana). However, one is in the presence of completely exceptional relationships [76] when one passes on to brothers-in-law (astikosu, a1; tarúte, b1), or more exactly (since the name astikosu does not arise from marriage with the sister but is previous to it) to cross-cousins (masc.).

SP17 Nambicuara SP17

621 people are seldom met together, the average size of the bands being twenty individuals, women and children included. This demographic collapse cannot possibly have taken place without affecting the structure of the band. But here, too, we do not need to concern ourselves 121 with such questions as the type of political organisation in earlier times. It is probably more difficult to understand Nambikuara sociology now than it was thirty years ago. Perhaps, on the contrary, the much reduced Nambikuara band offers, better than in the past, a privileged field for a study in social anthropology. My contention is that, precisely on account of its extreme impoverishment, Nambikuara political structure lays bare some basic functions which may remain hidden in more complex and elaborate systems of government.

[36] Each year, at the end of the rainy season, that is, in April or in early May, the semi-permanent dwellings laid in the vicinity of the 621 gallery-forest where the gardens are cleared and tilled, are abandoned and the population splits into several bands formed on a free choice basis. Each band includes from two to about ten families usually tied by kinship. This may be misleading when a band is met, for one easily gets the impression that it is formed as an extensive family. It 60 does not take long to discover, however, that the kinship tie between [60] two families belonging to separate bands may be as close, and eventually closer, than between two families inside the same band. The [58] Nambikuara have a simple kinship system based on cross-cousin marriage and the subsequent dichotomy between "cross" and "parallel" in every generation. Therefore, all the men in one generation are either "brothers" or "brothers-in-law," and men and women are to one another either siblings (true or classificatory) or spouses (true or classificatory). Similarly, children are, in relation to the adults, either sons and daughters (true or classificatory) or nephews and nieces, which is the same as actual or potential children-in-law.[1] As a result, there is no great choice of terms to express kinship, and this explains why kinship inside the band may appear closer than it actually is, and kinship between people belonging to different bands more remote than shown 602 by genealogies. Furthermore, a bilateral cross-cousin marriage system functioning in a relatively small tribe must produce a progressive 621 narrowing, and even a multiplication, of the kinship ties between any two individuals. This is a supplementary reason preventing family

SP17 Nambicuara SP17

relationship from becoming really operative in the constitution of the band. It can be said that, inside the band as well as between the different bands which are the offspring of the same temporary village, everybody is everybody's kin, in pretty much the same fashion.

Why then the splitting-up process? Two different considerations must be brought forth to answer this question. From an economic point of view, the scarcity of wild food resources and the subsequent high square-mileage needed to feed one individual during the nomadic period make the division into small bands almost compulsory. The real question is not why there is a division but rather on what basis it takes place. I have said that this is done by free choice, but this freedom is not arbitrary. There are, in the initial group, several men acknowledged as leaders (who likely acquired this reputation from their behavior during the nomadic life) and who make the relatively stable nuclei around which the different aggregates center. The importance, as well as the permanence of the aggregate through successive years, depend largely upon the ability of each of these leaders to keep his rank and eventually to improve it. Thus, it may be said that leadership does not exist as a result of the band's needs, but, instead, that the band receives its shape, its size, and even its origin, from the potential leader who antedates it.

There is, however, a continuous function of leadership, although not permanently assumed by the same individual. Among the Nambikuara, chieftainship is not hereditary. When a chief grows old, or is taken ill, and when he does not feel able to fulfill his heavy duty any more, he himself designates his successor. "This one—this one will be the chief . . ." he says. It seems likely that this autocratic power to insure one's own succession is more apparent than real. We shall emphasize later on the small amount of authority enjoyed by the chief and, in this case as in many others, the final decision is probably preceded by a careful survey of public opinion, the designated heir being, at the same time, the one with the greater support from the members of the band. The appointment of the new chief is not only limited by the wishes or disapproval of the band; it needs also to correspond to the plans of the individual to be chosen. Not seldom, does the offer of leadership meet with a vehement refusal: "I don't want to be the chief." Then a new choice must be made. As a matter of fact, chieftainship does not seem to be coveted by many people, and the general attitude of the different chiefs I happened to know was less to brag about their

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

is consequently much wider than "brother-in-law" as we understand it, including as it does approximately half the masculine members of a man's generation; the rest, of course, receive the name "brother" (consanguineous or classificatory). It should be noted that in the Nambikuara kinship system men alone have brothers-in-law and, conversely, women alone have sisters-in-law.

Only in the case of brothers-in-law are the Nambikuara conscious of a link between a special type of behavior and the position occupied by a kinsman in the relationship system. Generally speaking, there are no rules of avoidance or of privileged familiarity between particular kinds of relatives. The relations with the spouse's parents do not differ substantially from those with the parallel uncle and aunt and, although it is true that relations between consanguineous or classificatory siblings are rather reserved, the natives are unable to define this diffuse behavior. As a matter of fact, while siblings and parallel cousins do not avoid each other, they do not joke or even talk together unless there is a special reason for doing so. Sisters-in-law, on the contrary, comport themselves very freely. They laugh and joke together and render each other small services, such as rubbing each other's back with urucu paste. And, more especially, exceptional relations are revealed when one passes to the brothers-in-law.

We have already mentioned the partial polygyny which exists in the group. The chief or shaman periodically withdraws several of the youngest and prettiest women from the regular cycle of marriages; consequently, young men often find it difficult to marry, at least during adolescence, since no potential spouse is available. The resulting problem is solved in Nambikuara society by homosexual relations, which receive the rather poetical name *tamundigi ki'ondige*—"sham love." Relations of this kind are frequent among young men and are more publicly displayed than heterosexual ones. Unlike most adults, the partners do not seek the isolation of the bush, but settle close to the camp fire in front of their amused neighbors. Although the source of occasional jokes, such relations are considered childish and no one pays much attention to them. We did not discover whether the partners aim at achieving complete sexual gratification or whether they limit themselves to such sentimental effusions and erotic behavior as most frequently characterize the relations between spouses. In any event, the point is that homosexual relations occur only between *male cross cousins*.

We never learned whether or not the same relations continue to exist between adult cross cousins; it does not seem likely. Nevertheless, the freedom and demonstrativeness displayed by brothers-in-law toward one another are not characteristic of the relations between brothers or between the members of any other class of relatives. One often sees among the Nambikuara (who, in fact, like to indulge in expressions of affection) two or three men, married and

115 a7. --A pretty woman of some twenty years, perhaps less; young
157 wife of A6. Her parents are living and reside, she says, in the village. She is asintu of A1 and a2, arindesu of a3 and a4, asecetasu of a5. She is stupid, egotistical, interested only in herself. She considers herself very seductive, which appears to be (from the Indian point of view, of course) very exaggerated. She systematically refuses to show the slightest interest in the two daughters of her husband, conducts herself very amorously as concerns him.

115 a8 and a9--About six and two years, daughters of the first mar-
855 riage of A6 and daughters of the deceased daughter of a14. The two
157 children are practically left to themselves. Their stepmother does not bother with them; their father takes care of them when his manly tasks and his wife permit him the time. Their grandmother is their
[603] chief aid and it is to her that they run when they hurt themselves, are hungry, thirsty or afraid. But she herself is absorbed by the cares of her sons, of her stepson (A15) and of her husband. And very often the baby is neglected for entire days, covered with ashes and filth, unless some woman of the group, seized by pity or simply [43] disgusted, takes her and gives her a bath. Most often it is her big sister, precociously mature, who takes care of her, carries her, even though she is scarcely any bigger, feeds her and cleans her up. Both are charming children, gay and hungry for caresses like those who are habitually deprived of them. Their lot is a great worry for the
[181] community. Under this regime of a hard life constantly absorbed by the small tasks, each one of which is hard work, one can with difficulty accept other cares than one's own. And these neglected children are a perpetual source of irritation, of which they are often the victims, even when taken care of. Many times we wondered if we should not take charge of the youngest of the children. They would have given her to us gladly. uThe baby was so cute that we would have been tempted if the perspective of seeing ourselves having a quarrel on the return trip with the Service for the Protection of the Indians had not, very reasonably, dissuaded us.

115 A10. --About 40 years. He is alonsu of A1, ajunkedisu of a2,
157 ahuinosu of a5, married to a11. His parents are dead. He is amiable and grinning, he suffers from a hernia which he hides under a piece of cloth hanging from his waist. His activity is considerably decreased. He is little interested in our work and not very eager to understand our questions and give us information.

a11. --About 40 years. Wife of A10. She is a "sister" of a2, a "wife" of A1, a "mother" of a5. She is dark, eager and industrious,

231 principal spectacle for amusement. One hears such exclama-
521 tions as:

22. ʒakhũninde ʃteru ɥirokũnene (b1)
The flying ants! He (the monkey) catches them to eat!

They talk to the monkey while giving him fruits: ɥoʂ, "take!" and as the monkeys live very intimately with the dogs, they laugh hilariously seeing their goings on:

23. hõte ɥãinde miramiraina hõte ɥairʃdnjena (b1).
The monkey mounts the back of the dog! The monkey bites the dog!

and again:

24. kuɣarisena tãkɣlahẽ tãkela aɣoriʂẽ kãdaʒena (b1).
It is balancing head down, head down it balances, it fell! (the monkey).

231 The children like to play at burning animals, and when
857 insects are involved, they are allowed to do so; but if they try
[865] to burn domestic animals by touching them surreptitiously with a piece of smoldering wood, they are severely reprimanded.

[74] THE GRANDPARENTS

603 We use the term in the classificatory sense, that is, the members of the third ascendant generation. In general, there are few—two in restricted group a1, five out of 75 persons in the enlarged group, three out of 31 in enlarged group b1 (in this estimate we do not include A1, a2 and a14, who can be classed as grandparents indirectly). This small number is
[165 explained, in part, by the very high mortality rate of the
887] Nambikwara, and partially also by the fact that aged persons, although participating in the nomadic life, do not move with the same mobility as the other members of the group, and are met more rarely. Whatever the case may be, the grandparents share the life of their descendants. The founding of a new family does not erase the ties between adults and their parents. We have underlined several examples while studying the phenomena
[592] of residence. Aged or widowed parents join the household of their son or daughter, either permanently or temporarily. Thus, in the absence of his son-in-law (A21) and of his wife (a18), A17 installs himself with his daughter (a22) and her baby (a23). She is the one who cooks manioc and cumaru nuts for the three.

603 611 On the other hand, grandparents behave toward their descendants so as to show the permanence of the filial line. a14 takes special care of her granddaughters (daughter's daughters), orphaned by the mother, a8 and a9. She feeds them, bathes them, and the baby spends her days near her, and often the nights. When the group travels, she is the one who carries her when she can no longer walk. But above all, when a piece of game has been brought in by a hunter, one sees in the choice of beneficiaries, outlined in the heart of the group, the limits of a unit greater then the conjugal family, and whose reality appears only rarely in daily circumstances.

224 602 Thus, when a boa sucuri (irɨtasu, al: Eunectes murinus) has been brought in one day by A17, he gives the tripe to his daughter a19, who passes it on to her sister a22; the latter divides it between a12 and a5 (her "daughters") and reserves a portion for herself; at the same time A17 cuts the body into portions which he gives to A13, A1, A21, and of which he keeps part. Here, the division is almost coextensive with the restricted group. But, in more serious circumstances (1), the division of

1. P. 106 sq., cessation of menses (état de marge).

an irara (inihɨnuklesu, al; Mustela sp.) by A21 gives rise to the following distributions:

A quarter to a18 (wife's mother);
A quarter to a2 (wife's elder sister);
A quarter to a14 (brother's wife);
A foot to a19 (wife's younger sister);
A half-head to A17 (wife's mother's husband).

[75] He consumes the rest with his wife and baby, and the beneficiaries divide their share with spouse and children. Thus in the heart of the group there is outlined an even more restricted unit:

Fig. 17.

224 602 that of the members of a same bilateral family. Likewise, in the pounding of manioc, a2, a14, a18, a22 often work together and prepare a collective mass which will be divided among the same families, and will serve as food for the same persons as those represented in the above chart.

602 ●603 157 We do not know whether to attribute certain striking behavior of A17 to his classificatory position or to his individual characteristics. He is very clearly conscious of his almost patriarchal position in the midst of the group and of the fact that all the members, or almost all, are as regards him: asuittu, asuittu, tauéttu, tauéttu, tauéttu; he dwells on it, complacently enumerating the terms with grand gestures. He is gay, jovial and finds evident satisfaction in conversation about erotic subjects, contributions to which he enhances by mimicry and appropriate contortions. Within the group, in whose activities he shares only partially, he holds no authority, explicit or implicit.

RELATIVES AND ALLIED INDIVIDUALS
OR
COLLATERALS AND RELATIVES BY MARRIAGE

602 606 There is no apparent difference between the behavior of an individual as regards his spouse's parents and his behavior as regards his own parents. That is, from the point of view of individual relationships, the order of generations takes precedence over that of degrees. Parents-in-law, parents of the third degree, are concretely classed in the second generation ("fathers" and "mothers"). The same can be said for relationships of the wife's father and mother, or of the husband's, with the spouse of these latter. No special prohibition could be noted.

607 605 Sisters-in-law (aseétasu, a1; ndédere, b1) enjoy very free contacts among themselves. They laugh, joke together, do one another small services such as that of mutually rubbing the back with the tincture of urucu (Bixa orellana). However, one is in the presence of completely exceptional relationships [76] when one passes on to brothers-in-law (asúkosu, a1; tarúte, b1), or more exactly (since the name asúkosu does not arise from marriage with the sister but is previous to it) to cross-cousins (masc.).

224 602 that of the members of a same bilateral family. Likewise, in the pounding of manioc, a2, a14, a18, a22 often work together and prepare a collective mass which will be divided among the same families, and will serve as food for the same persons as those represented in the above chart.

602 603 157 We do not know whether to attribute certain striking behavior of A17 to his classificatory position or to his individual characteristics. He is very clearly conscious of his almost patriarchal position in the midst of the group and of the fact that all the members, or almost all, are as regards him: asuittu, asuittu, tauéttu, tauéttu, tauéttu; he dwells on it, complacently enumerating the terms with grand gestures. He is gay, jovial and finds evident satisfaction in conversation about erotic subjects, contributions to which he enhances by mimicry and appropriate contortions. Within the group, in whose activities he shares only partially, he holds no authority, explicit or implicit.

RELATIVES AND ALLIED INDIVIDUALS
OR
COLLATERALS AND RELATIVES BY MARRIAGE

602 606 There is no apparent difference between the behavior of an individual as regards his spouse's parents and his behavior as regards his own parents. That is, from the point of view of individual relationships, the order of generations takes precedence over that of degrees. Parents-in-law, parents of the third degree, are concretely classed in the second generation ("fathers" and "mothers"). The same can be said for relationships of the wife's father and mother, or of the husband's, with the spouse of these latter. No special prohibition could be noted.

607 605 Sisters-in-law (aseétasu, a1; ndédere, b1) enjoy very free contacts among themselves. They laugh, joke together, do one another small services such as that of mutually rubbing the back with the tincture of urucu (Bixa orellana). However, one is in the presence of completely exceptional relationships [76] when one passes on to brothers-in-law (asúkosu, a1; tarúte, b1), or more exactly (since the name asúkosu does not arise from marriage with the sister but is previous to it) to cross-cousins (masc.).

838 Because of the fact of partial polygamy which reigns within
[595 the group, and which is manifested in the fact that the youngest
582] and prettiest women are periodically withdrawn by the chief or
●605 the shaman from the regular cycle of marriage, the young men often find themselves in difficulty as regards marriage, at least during part of their adolescence, no potential wife being available. This problem is resolved by homosexual relationships, which the Nambikwara language (b1) has named poetically: tamindige kihãdige, that is false love. These relationships are frequent among young people and are carried on much more publicly than normal relations. The couples do not retire to the bush as the adults usually do. They install themselves near a fire of the camp under the amused eyes of the neighbors. The incident gives rise to some joking comments, usually not carried very far. These relations are considered infantile, and hardly any attention is paid them. The question remains unanswered for us as to whether these practices are carried on to complete satisfaction, or are limited to sentimental effusions, accompanied by erotic play such as those which characterizes, for the most part, relations between husband and wife. Whatever the case may be, the essential point here is that homosexual relations are exclusively relations between cross cousins. Whenever one seeks information from an Indian concerning a relationship of the type just described, the typical response obtained is:

25. tarutebãdige tamĩndige (b1)
(those are) two brothers-in-law making love.

838 We have not been able to ascertain if these relationships of
605 adolescence continue between adults. It seems hardly probable.
607 But relationships of a very special nature are maintained between "brothers-in-law. They exhibit great familiarity toward one another, have among themselves effusions such as we have never noted among brothers or relatives of another degree. Among the
[201] Nambikwara (always prodigious, of course, with affectionate gestures) it is not rare to see two or three men, married and fathers of families, walking in the evening tenderly embracing. The information obtained is, here too, always the same:

26. tarũte ialhasi?ete. (b1)
The brothers-in-law are embracing.

607 Certain games, like the "the game of claws (griffes)"
524 (kajrobĩtunubi, c) are frequent among brothers-in-law.

●605 But the relationship of "cross-cousins potentially or effectively allied by the marriage of their sister"--which seems to be the most adequate equivalent of the [77] term tarûte--can be extrapolated largely above and beyond family relationships. In certain cases, it is used to create, among individuals without relations, original ties whose role is to fuse, indirectly, in a same family group, groups formerly heterogenous. It was noted
621 at the beginning of this work (1) that the central and southern
182
184

1. See p. 6.

groups have decreased quite considerably owing to the epidemics of the last fifteen years. Some of them have seen their power reduced to such a degree that the following of an independent social existence in such conditions might seem an illusory objective. Certain ones then grouped together in the hope of reconstituting a workable unity. Thus it is that when we found them the group designated under the title b1 (restricted), comprising 18 persons, and group c, comprising 34 persons, lived together, under the authority of their respective chiefs, but these working together. It is to be presumed also that the decrease in number was not the only reason for that alliance, and that group c represented a fraction of a more numerous group which it had been forced to flee for an undetermined reason. It probably sought greater security in the nomad's life shared with group b1. Some rather obscure events (2) which occurred

2. See p. 103.

during our stay let us glimpse the political background whose details we do not know. Whatever the case may be, the two groups traveled together, camped at the same times, but without mixing their fires, the constituent families forming two adjacent agglomerations. The most surprising trait of this or-
[[91]] ganization was that the two groups did not speak the same language and could not communicate with one another except through one or two individuals belonging to each group who acted as interpreters. Notably, no direct communication existed between B1, chief of the Tarundé, and his colleague C20, chief and shaman of group Sabané. In fact, if there is

In fact, if there is
621 no doubt concerning the close affinity of dialects a1, a2, b1 and b2,
[197] which do not differ among themselves except as the derivations
182 of a mother language, dialect c offers, as regards the preceding,
184 such profound differences that one does not know if one is in the presence of a language of the same family. In any case, in whatever way linguistic study might resolve this problem, it can be reasonably set forth. We do not hesitate, nevertheless (and in spite of anthropological differences), to place group c in the cultural family of the Nambikwara, because of the identity of material culture and way of life, and especially because of the psychological attitude of groups b1, b2 and c as regards one another, who ostensibly recognize their community.

621 The union of the two groups posed a problem, that of the
●605 nature of the relationships which would go on between their respective members. This problem [78] has been resolved by the recognition of all male members of group c as being "cross-cousins"—tarũte, of all the adult males of group b1, and of all the adult males of group b1 as being the jõpa (corresponding to "cross-cousin" in the vocabulary of parentage of group c) of all the adult males of group c. The result, consequently, is that if all the husbands of the two groups are "brothers-in-law among themselves," all the "wives" of a group are "sisters" of the husbands of the other, and all the children of both sexes, in a group, potential husbands or wives of the infants of the other group belonging to the opposite sex. The blood fusion of the two groups is thus definitely assured for the following generation. Here is a type situation which one finds thus realized:

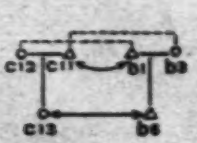

Fig. 18.

The systematic character of this solution is not doubtful. The informants belonging to group b or to group c, when we interrogated them concerning their kinship relationship regarding a male adult of the allied group, never furnished us with a special answer concerning the considered case, but remarked

621 instead that all the Sabané men were for them tarũte, or that all
605 the Tarundé men were jõpa. As a general rule they did not take the trouble to formulate relationships between women, between children, or between adults and children. In all these cases, except several occasions when the deduction was specifically made, they gave as an answer the name of the group: it is called "Sabané" or "Tarundé." It is thus in the function of the relationship of tarũte or jõpa (asũkosu, al) that the system has been conceived and applied.

This fact merits attention, for if the goal of the system were only to assure intermarriages, one could proceed in two other ways, or, more exactly, give two other interpretations for the same solution; one consisting of posing all the women as "sisters-in-law," the other treating all the men of one group and all the women of the other, respectively, as being among themselves "brothers and sisters," and the result would have been the same. Of course, these two aspects are implied in the proposed solution, as its correlaries. However, the solution itself, which could be presented in three different and equivalent ways, has actually been thought, in preferential fashion, to be in the function of the relationship existing between the male and allied collaterals. Several suggestions should thus be examined.

601 [79] Of the three possible solutions, two implied taking the women into consideration, one only was purely masculine, and it is that one which has been chosen. One must not be astonished if, as we suppose, the problem posed was a political problem, thus arising from command, exclusively exercised by the men, and not by a normal play of filiation, which seems rather a
[582] matter of female lineage (1). Although in a simple system of

1. See p. 39.

marriage between cross-cousins, as is the Nambikwara system, the "brothers-in-law among themselves" can be as easily the fathers of the mothers as the fathers of the fathers, this choice gives to the Nambikwara sociology, which to the present time we have had trouble characterizing from this point of view, a decidedly masculine tint, or rather, it bears witness of a tendency in that direction, at the same time that it constitutes the first outline of a social system coming to superimpose itself on the purely family structures to which we have been limited

224 602 that of the members of a same bilateral family. Likewise, in the pounding of manioc, a2, a14, a18, a22 often work together and prepare a collective mass which will be divided among the same families, and will serve as food for the same persons as those represented in the above chart.

602 603 157 We do not know whether to attribute certain striking behavior of A17 to his classificatory position or to his individual characteristics. He is very clearly conscious of his almost patriarchal position in the midst of the group and of the fact that all the members, or almost all, are as regards him: asuittu, asuittu, tauéttu, tauéttu, tauéttu; he dwells on it, complacently enumerating the terms with grand gestures. He is gay, jovial and finds evident satisfaction in conversation about erotic subjects, contributions to which he enhances by mimicry and appropriate contortions. Within the group, in whose activities he shares only partially, he holds no authority, explicit or implicit.

RELATIVES AND ALLIED INDIVIDUALS
OR
COLLATERALS AND RELATIVES BY MARRIAGE

602 606 There is no apparent difference between the behavior of an individual as regards his spouse's parents and his behavior as regards his own parents. That is, from the point of view of individual relationships, the order of generations takes precedence over that of degrees. Parents-in-law, parents of the third degree, are concretely classed in the second generation ("fathers" and "mothers"). The same can be said for relationships of the wife's father and mother, or of the husband's, with the spouse of these latter. No special prohibition could be noted.

607 605 Sisters-in-law (aseétasu, a1; ndédere, b1) enjoy very free contacts among themselves. They laugh, joke together, do one another small services such as that of mutually rubbing the back with the tincture of urucu (Bixa orellana). However, one is in the presence of completely exceptional relationships [76] when one passes on to brothers-in-law (asúkosu, a1; tarúte, b1), or more exactly (since the name asúkosu does not arise from marriage with the sister but is previous to it) to cross-cousins (masc.).

224 602 that of the members of a same bilateral family. Likewise, in the pounding of manioc, a2, a14, a18, a22 often work together and prepare a collective mass which will be divided among the same families, and will serve as food for the same persons as those represented in the above chart.

602 603 157 We do not know whether to attribute certain striking behavior of A17 to his classificatory position or to his individual characteristics. He is very clearly conscious of his almost patriarchal position in the midst of the group and of the fact that all the members, or almost all, are as regards him: asuittu, asuittu, tauéttu, tauéttu, tauéttu; he dwells on it, complacently enumerating the terms with grand gestures. He is gay, jovial and finds evident satisfaction in conversation about erotic subjects, contributions to which he enhances by mimicry and appropriate contortions. Within the group, in whose activities he shares only partially, he holds no authority, explicit or implicit.

RELATIVES AND ALLIED INDIVIDUALS
OR
COLLATERALS AND RELATIVES BY MARRIAGE

602 606 There is no apparent difference between the behavior of an individual as regards his spouse's parents and his behavior as regards his own parents. That is, from the point of view of individual relationships, the order of generations takes precedence over that of degrees. Parents-in-law, parents of the third degree, are concretely classed in the second generation ("fathers" and "mothers"). The same can be said for relationships of the wife's father and mother, or of the husband's, with the spouse of these latter. No special prohibition could be noted.

607 605 Sisters-in-law (aseétasu, a1; ndédere, b1) enjoy very free contacts among themselves. They laugh, joke together, do one another small services such as that of mutually rubbing the back with the tincture of urucu (Bixa orellana). However, one is in the presence of completely exceptional relationships [76] when one passes on to brothers-in-law (astikosu, a1; tarite, b1), or more exactly (since the name astikosu does not arise from marriage with the sister but is previous to it) to cross-cousins (masc.).

838 Because of the fact of partial polygamy which reigns within
[595 the group, and which is manifested in the fact that the youngest
582 and prettiest women are periodically withdrawn by the chief or
605 the shaman from the regular cycle of marriage, the young men often find themselves in difficulty as regards marriage, at least during part of their adolescence, no potential wife being available. This problem is resolved by homosexual relationships, which the Nambikwara language (b1) has named poetically: tamindige kihãdige, that is false love. These relationships are frequent among young people and are carried on much more publicly than normal relations. The couples do not retire to the bush as the adults usually do. They install themselves near a fire of the camp under the amused eyes of the neighbors. The incident gives rise to some joking comments, usually not carried very far. These relations are considered infantile, and hardly any attention is paid them. The question remains unanswered for us as to whether these practices are carried on to complete satisfaction, or are limited to sentimental effusions, accompanied by erotic play such as those which characterizes, for the most part, relations between husband and wife. Whatever the case may be, the essential point here is that homosexual relations are exclusively relations between cross cousins. Whenever one seeks information from an Indian concerning a relationship of the type just described, the typical response obtained is:

25. tarutehãdige tamĩndige (b1)
(those are) two brothers-in-law making love.

838 We have not been able to ascertain if these relationships of
605 adolescence continue between adults. It seems hardly probable.
●607 But relationships of a very special nature are maintained between "brothers-in-law. They exhibit great familiarity toward one another, have among themselves effusions such as we have never noted among brothers or relatives of another degree. Among the
[201] Nambikwara (always prodigious, of course, with affectionate gestures) it is not rare to see two or three men, married and fathers of families, walking in the evening tenderly embracing. The information obtained is, here too, always the same:

26. tarũte ialhaĩ?ete. (b1)
The brothers-in-law are embracing.

607 Certain games, like the "the game of claws (griffes)"
524 (kajrobĩtunubi, c) are frequent among brothers-in-law.

TN 601 171 582 the same sense when he writes: "It is their custom to marry the women who are their nieces, daughters of their brothers of their sisters; they regard them as their true and legitimate wives. The fathers of these women cannot refuse them, and no one, except their uncle, can claim to marry them (1)." One can refer also to

1. Pedro de Magalhes de Gandavo, The Histories of Brazil, The Cortes Society, New York, 1922, II, ch. X, p. 89.

Nobrega, Vasconcellos, Soares de Souza (2).

2. Nobrega, Cartas do Brazil, 1549-1560, Rio de Janeiro, 1931, p. 148;--Vasconcellos, Chronica da Companhia de Jesu do Estado do Brasil, Lisboa, 1865, I, LXXXII, p. 133; Soares de Souza, Tratado, CLVII, CLII.

TN 595 171 As regards polygamy and the distinction, so clear among the Nambikwara, between the first wife devoted to household tasks and the secondary wives, companions of the men and sharing their obligations, it will be remembered that Magalhães de Gandavo alludes to a category of women actually unmarried, but who take part in masculine activity (3).

3. Gandavo, loc. cit., II, Ch. 10, p. 89. One will find other information about the family organization of the ancient Tupi in: A. Métraux, La religion des Tupinamba (Paris, Leroux, 1928), passim; —Lafone Quevedo, "Guarani kinship terms as an index of social organization (American Anthropologist, Vol. 21, 1919), p. 421-440; —P. Kirchhoff, "Die Verwandtschaftorganisation der Urwaldstämme Südamerikas (Zeitschrift für Ethnologie, Vol. 63, 1931, Ch. 15, p. 182).

TN 607 171 All of these observations authorize us to trace a parallel between the extension of the relationship of "brother-in-law" among the Nambikwara, and a custom, seemingly very close, of the ancient Tupi. First we quote from Yves d'Evreux: " A party of Frenchmen was dispersed throughout the villages to live there according to the

I: Lévi-Strauss--95 E-5 (1938-1939)1948 SP17 Nambicuara SP17
Tupinamba 509

T 607 171 customs of the country, which is to have Chetonasaps or hosts or godfathers, giving them merchandise instead of money; and this hospitality or godfathership is very strict among them: for they actually consider you their children while you live with them, they go hunting and fishing for you, and moreover their custom was to give their daughters to their godfathers" (4). Farther on he speaks

4. Voyage dans le nord du Bresil. Ed. F. Denis, Leipzig and Paris, II, 14.

of the "French who were lodged by godfathership in these villages."(5)

5. Loc. cit., XXVIII, 109.

T 582 The indigenous institution is confirmed by Jean de Léry (6): "it is

6. Loc. cit. II, Ch. 20, p. 133; cf. also, Cardim, Tratado da Terra e da Gente do Brasil, Rio de Janeiro, 1925, p. 169-170.

to be noted that these words Atourassap and Coton-assap differ, for the first signifies a perfect alliance among them and between them and us, to the extent that the goods of one are common to the other. And also that they cannot have the daughter or the sister of the first named." The "Coton-assap" is consequently, inversely as regards the preceding, privileged in two forms of marriage: that with the sister of his partner, who makes him a "brother-in-law," and that with her daughter, that is an admission to the number of maternal uncles, making of him a N T 607 171 theoretical brother of the wife, which leads to the same result.

[83] It is necessary to note another analogy in the relationship between brothers-in-law among the Nambikwara and among the Tupi. All the texts which we have quoted agree in admitting the existence among the Tupi of a sort of authority exercised by the young men over their sisters. The marriage of cross-cousins seems to result from a mutual exchange of sisters among the men who are related in this way. The same thing can be said when the father gives his daughter to his wife's brother. Thus, actual or potential brothers-in-law are tied by a relationship of a special nature, founded on an exchange of services N of a sexual order. We have seen that such a relationship also exists [338] among the Nambikwara brothers-in-law, with this difference that among the Tupi these services fall back on the sisters and daughters,

while (besides the preceding form) the Nambikwara brothers-in-law exchange payment directly in the form of homosexual relationships, which make up for the absence of an available sister.

We may now draw a conclusion. The ancient Tupi were acquainted with two types of preferential marriage: the marriage of cross-cousins, and avuncular marriage. The first appeared normally in the form of an exchange of sisters between two cross-cousins; the second resulted from a privilege over the daughter of the sister exercised by the mother's brother, or conceded to the latter by the sister's husband. In the two cases, the marriage is based on a pact between cross-cousins, brothers-in-law in right or in fact—which is the definition which we have retained for the Nambikwara terms tarute or jopa. Moreover, this relationship of "brother-in-law" can be established under the name of chetouasap (Yves d'Evreux) or coton-assap (Léry) between individuals which no bond of kinship united before, or relatives of a different or more distant type, and even between strangers (as was the case between French and Indians). The goal was to make possible intermarriage and to amalgamate families or groups, until that time heterogeneous, into a new social unit. One recognizes the procedure which we have described in connection with the fusion of the Sabané and Tarundé (1) groups.

1. The South American practice of utilizing kinship relationships to translate and establish social ties is attested by Von den Steinen (Unter der Naturvölkern Zentral Brasiliens, 2 Aufl. Berlin, 1897, p. 286), whom the Bakairi had decided to call "older brother" and the Mehinaku "maternal uncle." We have just established the equality of the terms "brother-in-law" and "maternal uncle" in a system of marriage between cousins (cross-) joined to the avuncular marriage. As to the use of the term "elder brother," this calls for two observations. In the first place, the kinship system of the Bororo, who are not far distant from the Xingu, modifies each generation in two stages of which the one (elder) is assimilated to the younger members of the former generation and the other (younger) to the older members of the next generation. In such a system, an "elder brother" might be, in fact, a real uncle and a potential brother-in-law. The second point brings to a focus the logical difference between

But the formal analogy of the two institutions should not disguise their truly opposite characters. In the Latin-Mediterranean society the bond, formerly mystic and now social, of compérage, can be transformed by marriage into an actual kinship line. Among the ancient Tupi, and among the Nambikwara, it is, on the contrary, the concrete kinship which furnished its model to a type of bond utilized to establish wider relationships.

That having been posed, there are two reasons why our authors could not have elaborated a pseudo-Indian institution after a European model. In the first place, men as familiar with religious problems as were Yves d'Evreux, Cardim and Léry, could not have likened a relationship whose first consequence, and the probable object, was to permit new types of marriage, to the relationship between godfather, godmother and relatives who observed very severe enforcement [85] of the prohibitions of marriage, especially since the thirteenth century. At the time when they were writing, the question had actuality, since it was set down in the program of the Council of Trent, where the ancient rules had to be a little softened. But we have a more decisive argument. From the arrival of the first missionaries, the two institutions, European and Indian, must have evolved side by side, especially among the baptized Indians. But neither they nor their European priests ever interpreted Christian sponsorship in terms of Indian compaternity. On the contrary, and more logically since the newly introduced institution carried restrictions regarding marriage, they treated it as a modality of the relationship of paternity. They likened the godfather to a classificatory father: "Thus, they (the children who come to receive baptism) regarded their godfathers as their real fathers and called them Cherou, meaning "my father," the French called them Cheaire, which means "my son," and the little girls Cheagire, "my daughter"... (1)

1. Yves d'Evreux, l. c., II, 1, p. 234.

We believe we have assembled enough information concerning the fundamental character of the relationship between brothers-in-law in the South American society so that the nucleus of an original institution of compaternity can be seen in it which appears still living among the Nambikwara. The documents here presented suggest (2)

2. An English version of these observations has been published under the title: "The social use of kinship

607 terms among brazilian indians," American Anthropologist Vol. 45, No. 3, 1943. In an interesting article dedicated to the Tupi system ("Notas sobre a interpretacão sociologica de alguns designativos de parentesco do Tupi-Guarani," Etnografia e lingua Tupi-Guarani, No. 9, São Paulo, 1946), J. Philipson reproaches me for having limited the relationship of compaternity to South America, and he invokes the example of numerous tribes of North America. That is to attribute too much ignorance to me: it is indeed certain that there exist, in the entire world, innumerable cases of special relationships between brothers-in-law, both cordial and hostile. But by including pell-mell all of these examples, one would fall back into errors of the old comparative sociology. By the term "compaternity" I have wished to identify a precise complex institution, where there come together in correlation a particular kinship system, well defined rules of marriage, and certain traditional psychological attitudes. It is possible, and even reasonable, that one could find this uniformity in other regions of the world. But none of the examples mentioned by Philipson reveal this clearly.

its vast distribution in indigenous America of former times.

Part II

SOCIAL LIFE

128 It is obviously impossible, when one studies the existence of small nomadic bands all of whose members are related among themselves or from one band to the other, by a kinship relationship, to trace a clear line of separation between family life and social life. Many traits which come from the latter have been pointed out in the preceding pages. We shall not examine then in this chapter, more than certain aspects of the social life which concern the collective whole, either in its own existence or in its relations with neighboring groups.

THE SOCIAL USE OF KINSHIP TERMS AMONG BRAZILIAN INDIANS

By CLAUDE LEVI STRAUSS

121 607 THE kinship system of the Nambikuara Indians of the Western Matto Grosso is one of the most simple in Brazil. At the same time it is typical of a sociological pattern, cross cousin marriage, which according to our present information seems to have been very common throughout South America. The object of this article is to compare the familial organization of the Nambikuara with that of other tribes described in the older literature and to show that a certain kinship tie, the brother-in-law relationship, once possessed a meaning among many South American tribes far transcending a simple expression of relationship. This significance, still observable in Nambikuara culture, is both sexual and politico-social; and, owing to its complexity, the brother-in-law relationship may perhaps be regarded as an actual institution. Since the sixteenth century travellers and sociologists have failed to devote sufficient attention to the phenomenon, probably because it could readily be interpreted as a development of the imported Iberian *compadre* relationship. In our opinion, on the contrary, the brother-in-law relationship, together with its remarkable implications, constitutes an indigenous aboriginal institution based on the pattern of native culture. Nevertheless, it presents a striking example of convergence in which the native and Latin-Mediterranean institutions show numerous apparent similarities overlying important structural differences.

131 133 The Nambikuara Indians are settled on the upper courses of the feeders of the Tapajoz River, between the eleventh and the fifteenth parallels. Their territory consists of a semi-desert savanna, which contrasts with the narrow gallery forests along the main waterways. The fertile soil of these forests allows [511] the natives to cultivate a few gardens in the rainy season, but during most of the year the Nambikuara subsist mainly by hunting and gathering wild food. 177 Compared to the majority of Brazilian tribes, their cultural level is low. As they were discovered only in 1907 and as they had practically no contact with white civilization between the year of the Rondon-Roosevelt Expedition in 1914 and the time of our own field work in 1938–39, their familial and social organization may be considered still intact.

601 The Nambikuara kinship system may be summarized as follows: All the father's brothers are classified together with the father and are called "father," and all the mother's sisters are classified with the mother and are called "mother." The father's sisters and the mother's brothers are classified together with the spouse's parents and the parents' parents in a single category which denotes simultaneously the cross aunts and cross uncles, the mother-in-law and father-in-law, and the grandparents. Passing to Ego's generation, the parallel cousins, both the children of the father's brothers and of the mother's sisters, are merged with siblings and are called "brother" and "sister," Turn-

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

ing to the children of the father's sisters and of the mother's brothers, a man calls all his female cross cousins (to one of whom he is or will be married) "wife," and all his male cross cousins "brother-in-law;" conversely, a woman calls all her male cross cousins (among whom her actual or potential husband is numbered) "husband" and all her female cross cousins "sister-in-law." No terminological difference is made between actual and potential spouses. The members of the next younger generation are similarly divided into "sons" and "daughters" (Ego's own children and parallel nephews and nieces) and "sons-in-law" and "daughters-in-law" (Ego's cross nephews and nieces), since these are or may be the spouses of his children.

The system is somewhat complicated by secondary distinctions made between elder and younger siblings and by the fact that another kind of marriage ——between a maternal uncle and his niece—is also practised. This new pattern usually appears in the polygynous unions which, in the prevailingly monogamous Nambikuara society, are the privilege of the chief. This point needs some elaboration. Nambikuara polygyny results from the fact that, subsequent to a first marriage having all the characteristics of the common (i.e., the cross cousin) form, a man may contract one or more unions of somewhat different nature. Actually, the position of his new wives is not the same as that of his original one, and, although constituting real marriages, the later unions are nevertheless psychologically and economically different from the first. The atmosphere in which they evolve is less conjugal and more like a kind of amorous friendship. The younger wives cooperate more extensively in the numerous tasks imposed on their husband because of his special social obligations. Furthermore, the activities of these women do not conform as closely as those of the first wife to the general pattern of the sexual division of labor. Finally, they are younger and are classified, in relation to the earlier wife, as "daughters" or "nieces." Such "oblique" unions (that is, between members of different generations) may also take place in monogamous marriages, but less frequently. Although their occurrence among the Nambikuara is an important point in our demonstration, the consequent modifications of the kinship system are not essential for the purposes of this article and we may therefore omit further mention of them. Our present observations will be limited to the special implications of the brother-in-law relationship which is expressed through the reciprocal terms *asúkosu* (Eastern dialect), *tarúiẹ* (Central and Western dialect) or *iópọ* (Northern dialect).

It must be emphasized immediately that this useful translation of the native term is not in any way accurate. While the *asúkosu* is a man's male cross cousin and also his potential brother-in-law, since the persons calling each other *asúkosu* (or *tarúiẹ* or *iópọ*) call each other's sisters "wife," it is only in particular instances that one or more of the individuals involved is, in fact, the wife's brother or the sister's husband or both. The meaning of the term *asúkosu*

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

607 is consequently much wider than "brother-in-law" as we understand it, including as it does approximately half the masculine members of a man's generation; the rest, of course, receive the name "brother" (consanguineous or classificatory). It should be noted that in the Nambikuara kinship system men alone have brothers-in-law and, conversely, women alone have sisters-in-law.

602 687 Only in the case of brothers-in-law are the Nambikuara conscious of a link between a special type of behavior and the position occupied by a kinsman in the relationship system. Generally speaking, there are no rules of avoidance or of privileged familiarity between particular kinds of relatives. The relations with the spouse's parents do not differ substantially from those with the parallel uncle and aunt and, although it is true that relations between consanguineous or classificatory siblings are rather reserved, the natives are unable to define this diffuse behavior. As a matter of fact, while siblings and parallel cousins do not avoid each other, they do not joke or even talk together unless there is a special reason for doing so. Sisters-in-law, on the contrary, comport themselves very freely. They laugh and joke together and render each other small services, such as rubbing each other's back with urucu paste. And, more especially, exceptional relations are revealed when one passes to the brothers-in-law.

607 838 We have already mentioned the partial polygyny which exists in the group. The chief or shaman periodically withdraws several of the youngest and prettiest women from the regular cycle of marriages; consequently, young men often find it difficult to marry, at least during adolescence, since no potential spouse is available. The resulting problem is solved in Nambikuara society by homosexual relations, which receive the rather poetical name *tamindige ki'dndige*—"sham love." Relations of this kind are frequent among young men and are more publicly displayed than heterosexual ones. Unlike most adults, the partners do not seek the isolation of the bush, but settle close to the camp fire in front of their amused neighbors. Although the source of occasional jokes, such relations are considered childish and no one pays much attention to them. We did not discover whether the partners aim at achieving complete sexual gratification or whether they limit themselves to such sentimental effusions and erotic behavior as most frequently characterize the relations between spouses. In any event, the point is that homosexual relations occur only between *male cross cousins*.

We never learned whether or not the same relations continue to exist between adult cross cousins; it does not seem likely. Nevertheless, the freedom and demonstrativeness displayed by brothers-in-law toward one another are not characteristic of the relations between brothers or between the members of any other class of relatives. One often sees among the Nambikuara (who, in fact, like to indulge in expressions of affection) two or three men, married and

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

sometimes the fathers of several children, walking together at dusk and tenderly embracing each other; always

tarûtę ialdsiętę

(these are) brothers-in-law embracing (each other).

Certain games, too, such as the "scratch game" (in which the opponents try to scratch each other especially in the face), are commonly played by brothers-in-law.

But the close relationship between "cross cousins actually or potentially allied through a sister's marriage"—the more accurate translation of the aboriginal term for brother-in-law—may extend far beyond the family tie. Actually, it is sometimes used to establish between individuals not belonging to the same kin group new links of a special nature, the function of which is to amalgamate into a single familial unit several formerly unrelated groups. This is brought out clearly in the following case.

During the past twenty years, several epidemics nearly destroyed the central, northern and western divisions of the Nambikuara. Several groups were decimated to such an extent that they could no longer successfully maintain a socially autonomous existence. In the hope of reconstituting functioning units, some of these, therefore, attempted to join forces, In the course of our field-work we met and worked with such a merged group made up of seventeen individuals using the northern dialect (*Sabânę* group) and thirty-four using the central dialect (*Tarûndę* group). Each of the originally distinct groups, however, lived under the guidance of its own chief, although both leaders closely cooperated. It is probable that the demographic crisis did not by itself account for this situation, since the people of the second group formed merely a fraction of a more numerous unit from which it had split off for reasons unknown to us. However, from several events which occurred during our stay with them, we deduced that the break had been caused by political dissention, the details of which remained obscure to us. In any event, these groups now travelled and lived together although two separate but contiguous camps were maintained in which the families formed distinct circles, each around its own fire. The most amazing feature of this curious organization was that the two groups did not speak the same language and were able to understand one another only through interpreters; fortunately, one or two individuals belonging to each group had sufficient knowledge of the other dialect to act as intermediaries. Even the two chiefs could not communicate directly. The problem of whether these dialects belong to the same linguistic stock need not be raised here; but the Northern group undoubtedly must be classified with the Nambikuara cultural family because of the similarities of material culture and of the life pattern, and chiefly because of the psychological attitude of the people, who very evidently believed in their close affinity to the Central group.

6: Le i-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

571 607 A more fundamental problem raised by the union of the two groups, namely the nature of the relations to be established between their respective members, was solved by the common statement that all the male members of the Sabáne group were to be acknowledged as the "brothers-in-law" (*tarútę*) of the male adults of the Tarúndę group, and, conversely, that the latter were to be acknowledged as "brothers-in-law" (*iópą*) by the former. Consequently, all the "wives" belonging to one group became the "sisters" of the "husbands" of the other, and the "sisters-in-law" of the latters' wives; and all children of both sexes in one group became the potential spouses of the children in the other. As a result, these two groups will be welded into a single consanguineous unit within two generations.

The conscious and systematic nature of this solution cannot be doubted. When asked for their kinship relation to any male adult of the allied group, the male informants, irrespective of the group to which they themselves belonged, never gave a different answer, but always emphasized that the question was meaningless since all the Sabáne men were their *tarútę*, or all Tarúndę men their *iópą*. On the other hand, no one seemed to have a clear idea of the exact relationship between the women, the children, or the adults and the children of the two groups. Occasionally the correct theoretical relationship could be deduced; more frequently only the group name was given in reply to our queries: She is calling the other one "Sabáne"—or "Tarúndę." Thus it may be assumed that the system was conceived of and applied according to (and exclusively according to) the *tarútę* (or *iópą*) relationship. This inference is rather important because, of course, the same result could have been achieved by other means.

If the sole aim of the system had been to ensure inter-marriage, it could have been brought about equally well in two other ways; perhaps we should say that two different interpretations might have been made of the same phenomenon. In the first place, the women might have been regarded as "sisters-in-law"; or, in the second place, all the men of one group and all the women of the other might have entered a brother-sister relationship. In both cases the result would have been the same as in the accepted interpretation, in which, indeed, these relationships are implied though not expressed. Nevertheless, the solution itself was actually based on the relationship between the male and his allied collaterals, the consequences of which must now be examined.

571 607 583 Two of the three possible interpretations implied the consideration of women; only one was purely masculine, and it is the latter which was adopted by the natives. The reason for the choice is obvious since the problem to be solved was a purely political one, concerning the chieftainship, which is exercised by men, rather than the normal mechanism of filiation, the pattern of which seems to be matrilineal. In a simple system of cross cousin marriage, such as that of the Nambikuara, the brother-in-law may be either the matri-

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

lateral or the patrilateral cross cousin; nevertheless, the chosen interpretation stresses the male side in Nambikuara society, or, let us say, it shows a strong tendency in this direction. At the same time we can see in such a solution a specifically social structure beginning to superimpose itself on the formerly simple familial units.

We do not intend in any way to base a theory of the origin of dual organizations on these restricted observations, the character of which is mainly anecdotal. However, this is a case where "the characteristic features of the sib organization are in some measure prefigured among sibless tribes";[1] as a matter of fact, in order to fulfil the main requirements of a system of exogamic moieties, it would be sufficient for the new unit, once fixed, to retain the recollection of its dual origin by preserving the habit of not mingling the camp fires.

Moreover, the extension of the "brother-in-law" relationship provides an instance of the increasingly superior position of the men within the group, since it is through the men that group alliances are brought about, just as wars are waged by men.

The preceding observations have a further value, since with their help we may be able to interpret sociological information found in the older literature on South America, especially that dealing with the Tupi of the Brazilian coast.

There are striking similarities between several features of the Nambikuara kinship system and what may be inferred about the ancient familial organization of the coastal Tupi. When describing small details of Nambikuara daily life, one is often tempted to quote Jean de Léry or Yves d'Evreux, so accurately do their words apply to certain live features of Nambikuara society, notwithstanding the fact that they were written four centuries before this culture became known. As a matter of fact, several metaphysical themes are common to both cultures and, indeed, certain names in the Nambikuara religious vocabulary have a conspicuously Tupi origin. The most important similarities, however, are those involving the kinship systems. In both cultures the same three principles of familial organization are stressed and are apparently similarly expressed: First the dichotomy of the parents' brothers and sisters between parallel uncles and aunts, called "fathers" and "mothers," and cross uncles and aunts, called "fathers-in-law" and "mothers-in-law;" secondly, the marriage of cross cousins with the correlative assimilation of parallel cousins to "brothers" and "sisters"; and, finally, the avuncular marriage, which, among the ancient Tupi, seems to have taken the form of a preferential union between the mother's brother and the sister's daughter.

An excellent text by Anchieta gives evidence of the occurrence of the first principle, as well as showing signs of the existence of the other two:

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

595 171 Regarding polygyny and the sharp differentiation made among the Nambikuara between the first wife who devotes herself to feminine activities and the younger wives who are their husband's companions and share his tasks, it may be recalled that Magalhaes de Gandavo[17] refers to a special category of women, single indeed, who shared in masculine activities.[18]

171 114 The preceding similarities may perhaps allow us to establish a valid comparison between our observations concerning the extension of the "brother-in law" relationship among the Nambikuara and what seems to have been a very similar institution among the ancient Tupi. We first quote Yves d'Evreux:

> They scattered part of the French through the villages so that they might live according to the custom of the land, which consists in having *chetouasap*, that is to say, hosts or god-sibs (*compères*), giving them merchandise instead of money. Such hospitality or god-sib relationship is very close among them, for they regard you as their child as long as you stay with them. They hunt and fish for you and, what is more, they used to give their daughters to their god-sibs (*compères*).[19]

The same author refers later to the "French who were established in the villages in a god-sib relationship (*compérage*)."[20] Evidence of the aboriginal institution may also be found in Jean de Léry:

> It is worth remarking that the words *atour-assap* and *coton-assap* differ, because the first signifies a perfect alliance between them and between them and us, so much so that the belongings of the one are common to the other. And also that they cannot have the daughter or sister of the first named.[21]

From this one may infer, conversely, that marriage is authorized with the sister and the daughter of the *coton-assap*. Therefore, the *coton-assap* is granted a double privilege: first, marriage with his partner's sister, which makes him a "brother-in-law"; and, secondly, marriage with his partner's daughter, which is equivalent to his assimilation to the rank of "maternal uncle";—then, because he is considered a theoretical brother of his partner's wife, he also becomes a theoretical brother-in-law. Actually, therefore, both privileges have the same result.

171 607 582 One more similarity between the Tupi and Nambikuara brother-in-law relationship remains to be pointed out. All the texts quoted agree that there existed among the Tupi a kind of authority held by young men over their

SP17 Nambicuara SP17

sisters. Cross cousin marriages seem to have resulted chiefly from a reciprocal exchange of their respective sisters by the male cross cousins. (The same holds for the giving of a daughter by a father.) The potential or actual brothers-in-law then enter into a relationship of a special nature based upon reciprocal sexual services. We know that the same thing may be said of the Nambikuara brothers-in-law, with the difference that, among the Tupi, the sisters or daughters of the brothers-in-law provided the object of these services, whereas among the Nambikuara the prestations are directly exchanged in the form of homosexual relations.

We may now summarize our observations. The ancient Tupi acknowledged two forms of marriage; namely, cross cousin marriage and avuncular marriage. The first was usually practised in the form of an exchange of sisters by two male cousins; the second appears to have been a right to the sister's daughter exercised by the mother's brother or granted to him by his sister's husband. In both cases the marriage is the result of an agreement between cross cousins, actually or potentially brothers-in-law—which is the definition we retained as a suitable translation of the Nambikuara terms *tarãtę* and *iópą*. Now, this special "brother-in-law" relationship could be established, under the name of *cheiouasap* (Evreux) or *coton-assap* (Léry), between individuals not united previously by any kinship tie, or else only more remotely related, or even between strangers (as was the case of the French and the Indians). The reason for such a step was to ensure intermarriage and by this means to amalgamate familial or social groups, previously heterogeneous, into a new homogeneous unit. One recognizes here the same process described in the analysis of the relations between the newly joined groups, Sabáne and Tarúnde.[2]

[2] The widespread South American custom of using kinship terms to express social relationships is attested to by Von den Steinen (*Unter der Naturvölkern Zentral Brasiliens*, 2 Aufl. Berlin, 1897, p. 286), who was called "elder brother" by the Bakairi and "maternal uncle" by the Mehinaku. We have just established the equivalence of the terms "maternal uncle" and "brother-in-law" in a system of cross cousin marriage combined with avuncular marriage. Regarding the use of the term "elder brother," two observations should be made. First, in a kinship system such as that of the Bororo, not far distant from the Xingu, each generation is to some extent split into two layers, the elder half being assimilated to the younger half of the generation above and the younger half to the elder half of the generation below. In such a system an "elder brother" may well be a true uncle and a potential brother-in-law.

The use of the term "brother" for social purposes may also be understood in another way. Among the Nambikuara, there is a special term, sometimes used to designate a sibling of the same sex, the meaning of which is "the other one." This term is applied not only to describe a familial relationship, but is also used to name objects belonging to a class which includes several units (for instance, the posts of the huts or the pipes of the whistles). Friendly groups may also consider themselves to be "brothers" and the exclamation, "You are no more my brother!" may often be heard in discussions between angry adversaries.

This suggests that the term "brother" possesses, in addition to its kinship significance, a very wide meaning, both logical and moral. Nevertheless, when the technical problem of establishing new social relationships is put up to the Indians, it is not the vague "brotherhood" which is called upon, but the more complex mechanism of the "brother-in-law" relationship.

601 husbands or wives, or of the true father or mother compared to the theoretical "fathers" or "mothers," or of true sons or daughters as compared to theoretical "sons" and "daughters." In most cases, the discrimination seems totally superfluous to the Indians, since it is so well accented by the differences of behavior. Sometimes also it seems useless because of the inverse of the preceding, the theoretical wife can become a real wife (for example in case of polygamy, or of remarriage), the theoretical father or mother, or the theoretical son
[608] or daughter, can play the role of true father or mother, or of true son or daughter, through the mechanism of adoption. This functions automatically, in the case of the father's death, the child then being [22]
[768] taken in and raised by its father's brother. In this case his father's brother, whom he has always called father, becomes for him a real father even though by substitution, and the wife of his father's brother, who is most often his mother's sister, and whom he has consequently always called mother, is from then on treated by him as such, especially if his own mother is dead or has remarried. However, sometimes the Indians wish to sharpen the theoretical character of the name. Then they add to the classifying term a descriptive term, whose approximate meaning is that of "relative" in the most general sense, as,

20. (akit) ʌjdnisu,

used in the substantive form above, or in the participial form ʌjdnere; or in the exclamatory form, in conversation, ʌjdneram.

Thus we have found the following appelations,

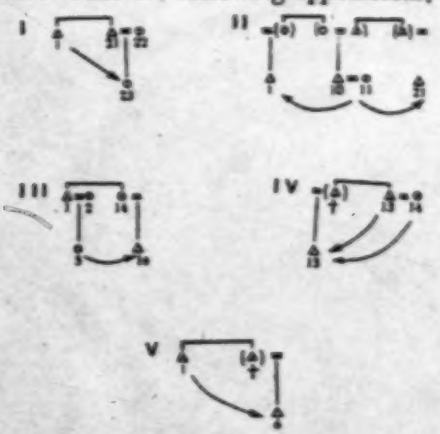

Fig. 3

I. aʔkineru ajdneram. --II. (t)oyensaesu ajdnisu. III. oyensaesu ajdnisu (among children). IV. tayettu aʔkiraru ajdneram. --V. akineram (aʔkirara ajdneram).

115 and only reveals her happy nature on occasions of songs and dances where
157 she excels. One always sees her occupied by some craft work which she seems to prefer—shaping or polishing disks of shells, drilling them through or filing them, rubbing earrings or bracelets. She talks little, letting herself be completely absorbed by her work. She is a wife and mother, and a remarkable informant for all details of the material culture.

a12. --Daughter of the preceding two, approximately 22 years; she is the wife of A73 who abandoned her to live with two women a74 and a75. Because of this, she returned to the charge of her parents, the more so because she is pregnant. She is placid, smiling and apathetic. She is separated from collective life by her condition
[164] and by a painful eye infection which struck her first among the members of her group of which several were later attacked by the epidemic.

A13. --About 40 years of age. Son of A18, "brother," consequently, of a2, "brother-in-law" of A1, whose older sister a14 he married. Always joyful, active and docile, he is the confidence man of A1, his preferred messenger, the companion he chooses for all complicated undertakings. He is industrious, a [44] not affected in his attitudes, and, as an informant, compliant, very verbose and not always clear or comprehensive.

a14. --About 40 to 45 years. Wife of the preceding, blood sister of A1, mother of A16. She is influential, active, diligent, at first quite rude, but in reality pleasing and competent. She exercises real authority over the other women of the group by her spirit of initiative and her pep. She is the grandmother of a8 and of a9 whom she feeds and whom she cares for frequently. Not only is she a good informant, but she sometimes takes didactic initiative. She loves songs and dances.

● [608] A15. --About 15 years. He is an orphan; his father was the brother of A13 who took him in. A gentle, tranquil, rather timid boy.

A16. --7 or 8 years; son of A13 and of a14, "husband" of a5. He is a lively and curious child; his mother rarely refuses him anything, and he tyrannizes her willingly. She is very proud of him and overlooks many of his whims. One day she came to ask us to teach him to read. The attempts are not very encouraging. He looks upon the lessons as a game and refuses to learn the letters as determined forms; for him they are interchangeable, and he attributes to them in turn all the sounds which he has in his vocabulary.

115 A17. --Between 50 and 55 years, he is the dean of the group; he
157 is conscious of this and gets a certain pride from having around him
602 only "sons" or "daughters," "sons-in-law" and "daughters-in-law,"

● 608

[For information on compérage, which is also a type of artificial kin relationship including siblings-in-law, see category 607.]

591 A27 with his son A28. All this offers a very confusing spectacle,
621 and it is not the only case among the Nambikwara where the sociologist feels discouraged from deducing fixed rules. In a case such as that of the rules of residence, the answers of the Indians and the study of the facts might lead one to conclude that these rules do not exist, but such a conclusion should not be accepted except with the most extreme reservations. We shall be forced from time to time to insist on the fact that, in a society whose demographic base is broken up in a very short space of time, the traditional rules might be clouded by the necessity of solving cases which have become individual and concrete by force of things. Among peoples who live under such strenuous conditions, a certain distribution in elementary associations of individuals of different sex and age might be decisive to assure the means of existence for each of them. Many family combinations seem thus to result from immediate necessities. It could also be that the rules exist, and are based on sociological
[8] reasons which escape us. A society made up of wandering bands which one never finds again with the same composition after a few weeks interval because certain members or families have left it, while others have come to join up; whose camps never offer the same exact distribution from day to day; whose winter huts are most
[509] often destroyed during the dry season; who flee one another, chase one another off, attack each other in frequent conflicts, and about which the least one can say is that in periods of peace, they avoid one another; whose [50] material culture, reduced to the strict minimum, puts into use only rudimentary techniques where social differentiations cannot be expressed; such a society offers to the sociologist ever-changing material, that is fleeting and often cannot be grasped. In very numerous cases, its laws of organization escape analysis and, supposing that they exist, could not be discovered except on the occasion of an extended visit, not only during the period of the nomadic life, but also of the sedentary life.

621 Central and southern group, dialect b1: tarũnde, maimãde (b1); mamãindeti (c) oãindesu, nikpietosu (a1).

We have divided the encampment of the two groups b1 and c. The latter is composed of 17 persons divided into five fires. Both
[10] were wandering in the zone of the line of the separation of waters
19 between the Tapajoz and the Madeira (Vilhena Rivers). We shall

855 863 8. nérisekihĩndage numĩ sekalajene élamnihĩs(bl)
The child has urinated! the hide! he is dirty! throw out(the urine)!

Later, when the child can isolate himself but not yet clean himself up, he is seen returning on all fours to his mother and remaining in that position while she applies the small twig in the way that has been previously described.

142 856 All children seem to have a pigmented blotch at birth to which no particular belief is attached. The informants only mention the phenomenon with that positive and detached attitude so striking on their part:

9. nĩtte ẑédeẑédednege tõodayige kã kã kã nudérige (bl)
the children marked with green are born, one day, one day, one day, it disappears.

The disappearance of the blotch actually seems to be very rapid.

593 602 609 One should, naturally, distinguish true parentage and classificatory parentage. The child does not adopt any particular form of conduct towards his "fathers" and "mothers" in the classificatory sense of the word. He treats them like other adults of the group. Often, furthermore, an individual calls a boy or girl much younger than himself father or mother (thus a19 and a20 are "mothers" of A6 and A24).

[597] [601] When an orphan is taken in by a parallel uncle or aunt, the classificatory parents take the place of true parents, and consequently the conduct changes. In general, the Indians do not use [67] a term to distinguish classificatory parents and children from blood ones. When seeking precision, they add the word tauẽttu (a1), tauẽtte (b1): "my little one," to the term for son or daughter (a?kiraru, a?kineru), whose connotation seems thus to be social first of all. The physiological acceptance of this springs from the fact that the word is also used to designate the young of animals, other terms being reserved for relationships of parentage in the human family.

855 157 The Nambikwara feel very real affection for their children, and show it as regards them, and they are repaid in turn. But these sentiments, however real and profound they may be, are often masked behind the nervousness and instability so characteristic of indigenous conduct. Also, as the following example will show, the risk is to let oneself be fooled by apparent indifference, and even momentary rudeness.

Little A16 suffers from indigestion; he has a headache, vomits, passes half the time groaning and the other half sleeping. He is ill, (intikãtu, a1), but no one, parents included, pays the least attention,

857 182 nuts for her sister a20 and eats them with her. When they are satisfied, they give the rest to a8, who cracks them, in turn, for her little sister.

857 The relationships between children giving each other the names husband and wife are more obscure, and we have not succeeded in forming a clear concept of them. We have pointed out a slight taboo exists concerning the expression of this kinship relationship. However, generally, the young "husbands" or "wives" do not manifest any special behavior toward one another, either positive or negative. Nevertheless, we have encountered indisputable cases where the young potential spouses conduct themselves as true spouses. In the evening they leave the family fire and carry burning pieces of wood to light their fire in a corner of the camp. The witnesses pay scarcely any attention to this action. For example, someone will make the remark:

18. ũftnaɨɾi ũfraɨre tiɬahete ũfraɨena noɾẽtenɨi etiɬtere (b1).
The children are taking fire to make a fire, they blow to make flames.

[72] and the young "husband" says to his potential wife:

19. tadoõtakɨi nikɨitũteraɨi etɬere aituɾuɨi natadahaki (b1)
Bend down! Stir the fire, carry! Look (for more). Put it there!

857 864 After this, they install themselves near their fire and give themselves over, insofar as it is within their means, to all the erotic acts that they have seen their elders practice. The incident is greeted by the adults with indifference, or, at the most, with amused smiles: ɨɾinõ taminɨsere, "there are the children having little sexual relations," they say in passing. We have only verified these practices in a haphazard way among the young children (5 to 7 years). They seem to be absent among those nearer puberty, but, in the latter case, a lacuna appears in our observations, due to the lack of subjects for comparison.

857 609 As regards strangers, the attitude of children is quite variable. Certain ones manifest fear and hostility for a long time:

20. tagẽtte ʔiina jaʔirina unjena (b1)
My child is frightened, he is ashamed, he doesn't move.

sometimes explained by a surprising external detail:

hersk*ɨoɨi ũɾena (b1)
he is afraid of glasses.

Others (or the same ones after several days or weeks of acclimatization) are curious, friendly, eventually mystifying. Thus,

857 b5, who insists that the treatment that one gives the small ani-
609 mal to divest it of its hair be applied to the ethnologist:

21. ulinyenághee n'ungeguedne (b1)

Put his beard in the fire! Roast his beard!

857 In general, they are to be good companions, enthusiastic, and
157 untiringly avid for games that are shown them. In exchange, they are very obliging informants once they have become friends. Al-
[55] most all the information which we were able to gather concerning proper names comes from them.

231 This chapter cannot be ended without presenting some observations relating to domestic animals. Not only do the children actually live in very intimate relationships with the animals, but the latter are treated in the family like real children at least outwardly. We mean that they share the group's food, benefit from the same manifestations of tenderness or interest—delousing, games, conversation, caresses—as the human beings. In everything, their treatment is [73] curiously the same. The Nambikwara have numerous domestic animals, first of all dogs, and cocks and hens, who are all descendants of those introduced in their region by the Rondon Commission; monkeys, parakeets, birds of various kinds, and finally, the caetetu, the coati (Nasua sp.), the jaguatirica. Only the dog seems to have acquired an
[229] occasionally utilitarian role in the service of women, for hunting with the digging stick (cf. quotation No. 16). The men never use them for hunting with bow and arrow. The other ani-
231 mals are raised for the purpose of pleasure. They are not eaten,
262 the people do not consume the eggs of the hens who lay them in the bush. But they do not hesitate to devour a young bird if it dies after a vain attempt at acclimatization.

The terms used for behavior regarding animals are the same as those used for humans. They say dehéna ulítte ulíkwage, "the woman caresses the baby," or ulínuette ulíkwage, "the woman caresses the puppy."

231 While traveling, except for the animals capable of walking,
482 the whole menagerie is packed with the other baggage. The monkeys, attached to the women's hair, adorn them with an amusing living helmet, elongated by the long tail curled around the neck of the bearer. The parakeets and hens perch on top of the baskets, other animals are held in the arms. None of them receive abundant nourishment but, even in days of need, they
231 have their share, however little it may be. As compensation,
521 they are an endless subject of distraction for the group, the

[i.e. from the children.--Analyst]

622 The command carries, moreover, a certain number of fixed offices. It is the chief who makes the poison for arrows; and he presides over ceremonies of initiation, of marriage or burial, concerning which we shall speak later. He organizes chants and dances, festivals both when they assume a ritual character, and when they have as a goal purely secular distraction. It is he who organizes 622 526 ball games. The ball game is widespread in western and northern Mato Grosso, for it is found from the Paressi to the tribes of the Lower Guaporé. Among the latter people we have been able to gather evidences of its sociological significance. It is perhaps the same among the Nambikwara; but, at least during the period of nomadic life, the ball game is practiced with a purely recreational goal in mind. The teams are built up haphazardly from those present and upon the spur of the moment, and the game takes place in a spirit of complete improvisation.

WAR AND TRADE

648 The two subjects should be treated simultaneously, commercial 609 exchanges usually representing potential wars peacefully re-[91] 439 solved, and the wars, the outcome of unhappy transactions. Among the numerous bands which cross through the bush during the dry season, it is necessary to distinguish those who are related by family ties, and who often represent the population of a winter village—or of a group of villages—which has "burst forth" in the pursuit of the nomadic life. Among themselves these bands entertain relationships which are normally pacific, although not necessarily so. On the contrary, bands which are strangers to one another, composed of members not related among themselves and whose geographic location is far distant, or who are even separated by differences of language, mistrust one another at the same time that they feel themselves necessary to one another. Only when they meet can they procure desirable articles which only one of them is capable of obtaining or of making. These articles seemed to us to belong essentially to three categories: first of all women, whom only victorious expeditions are permitted to carry off. Next seeds, notably bean seeds, and finally ceramics, or [283] even fragments of pottery used to make the weights of spindles. Group [284] al whose cultural level is clearly inferior (especially in its ignorance concerning pottery) to that of its western and southern neighbors, according to the word of its chief, had carried on several campaigns during the last few years with the goal of procuring these two last articles.

648 609 Also, the attitude of two bands who know that they are neighbors is very significant. They fear the clash of contact, and at the same time they desire it. In fact, they cannot meet one another accidentally, for for several weeks they watch the vertical smoke from the campfire which rises, perfectly discernable at some twenty kilometers, into the middle of the clear sky of the cold season. It is one of the most impressive spectacles of the Nambikwara territories when towards evening this smoke suddenly fills a horizon which one had thought deserted. Is the band which approaches friend or foe? They do not know, and they discuss at length their course of conduct. For days or weeks they avoid one another by maintaining a reasonable distance between the fires, then one day, according to whether the contact appears inevitable, desirable, or necessary, the women and children scatter in the bush and the men leave to face the unknown. We attended one of these "encounters" (nakohatige, b1). A long conversation is entered upon (dẽnihotige, b1) between the two bands reduced to their masculine elements, or more exactly, the leaders undertake, in turn, a sort of prolonged monologue, composed of exclamations, uttered one after another, in a tone at the same time plaintive and tearful, where the voice rises and trails off in nasal fashion at the end of each word. The group animated by warlike intentions exposes its grief. The peaceful protest their good intentions. It was not possible for us to reconstruct the word for word translation of this discourse. However, we give here the Indian text, insofar as we have been [92] able to get it, and its approximate translation, for the purpose of showing the construction and specific tone:

[537] 36. One group begins: ɲiaroẽndigẽ ninõkuẽ. --"We are very irritated! you are our enemies!" And, after a series of exclamations of this type, the other replies: iã oraɲẽ toɲadeẽ nuhaigiẑn nukmaetiẽ nukenaiɲi nukenitenohiñ moladeringuĩn nagataɲiɲot endigẽ. --"We are not irritated! We are your brothers! We are friends! Your friends! True friends! We can understand one another." (b1)

After having exchanged these peaceful protestations, the groups reform and a common encampment is organized, each group preserving its individuality and gathering together its fires, and sometimes songs and dances are organized in the course of which each group disparages its own exhibition to the profit of that of the other group:

648 37. tamaĩn ãtne munãitiere munãitienãitiore njanĩ (bl)
609 The Tamandé sing well; as for me, I cannot sing well any more!
201 In one case which we witnessed, the general tone was quickly raised with the excitement of the meeting, and the night had not yet ended before the speeches mixed with chants made an extraordinary uproar, whose significance escaped us completely. Menacing gestures were outlined, sometimes even some scuffles were produced while other Indians intervened as mediators. All of these hostile manifestations are stylized, and end as gestures calling to mind sexual parts of the body. On the part of the aggressor, menace, or the gesture of Nambikwara hostility, consists of seizing the penis with two hands and directing it towards the adversary while inflating the stomach and thrusting it out, and of flexing the knees (the men also make this gesture in fun toward children when they wish to get rid of them). The second stage consists of an act of aggression toward the person
[291] of the adversary, with a view to tearing off the piece of buriti straw attached to the front of the waist, above the sex organs. The latter "are hidden by the straw" and "they fight to tear away the straw." This action is entirely symbolic, for the covering of the male sex organs is made of such fragile material and is reduced so small in size (and often non-existent) that it is out of the question for it to assure protection of or be any kind of covering for the organs. Another form of aggression consists of seizing the adversary's bow and arrows and laying them aside. In all of these actions the attitude of the Indians is extremely tense as if they were (and really, they are) in a state of violent and contained anger. Doubtless these brawls degenerate at times into generalized conflicts, but in our case, they calmed down at dawn. Always [93] in the same state of apparent irritation, and with gestures devoid of friendship, the adversaries looked at one another to inspect one another, rapidly
[301] feeling the earrings, the cotton bracelets, the little feather ornaments, while murmuring rapid words:

38. tõhé tõhé kãhé kãhé muniniti (bl)
Give, give, see, see, it is pretty!

648 This "inspection of reconciliation" marks the normal conclusion
439 of the conflict. And actually it is this which introduces the new aspect which the relationships between the two groups are going to take--commercial exchanges. However summary the material culture of the Nambikwara may be, the products of the industry of the different groups are highly prized by their neighbors. The eastern groups need pottery and seeds; the northern and central groups consider

181 Caduveo, perhaps remindful of their slave-owning past, are proud, conceited, and boastful. The
171 Arawak-speaking Terena and Paressí, like the Arawak-speaking Waurá, are quiet, unassuming, friendly, and ready to help yet take no liberties. The Umotina speak only when spoken to and appear to wish to be by themselves. They provide information if they think the gifts are sufficient and to their taste; otherwise, they saunter off and are never available when required. An Umotina does just what he wishes to do and hates any kind of dictation. The Bacairí and Camayurá are intimately friendly, talkative, and ingratiating, expect gifts and bestow gifts in return, volunteer information, are full of humor and curiosity, and are clean and polite.

181 The Nambicuara, on the other hand, are surly,
576 and impolite even to rudeness. On many occa-
● 609 sions when I went to visit Julio at his camp he was lying down near a fire and as he saw me approach he turned his back to me saying that he did not wish to talk. The missionaries informed me that a Nambicuara will ask for some object several times and if it is not given to him he will try to take it. In order to keep the Indians out they would sometimes close the screen door, but if a Nambicuara really wanted to enter he would tear a hole in the screen and walk in. The Nambicuara have two well-recognized ways of showing disgust or disdain. One day I stopped a woman carrying a burden basket to take her photograph. She evidently did not like being stopped, for as she passed me a moment later she turned her back to me and passed wind. This the missionaries claimed is a very common custom of the Nambicuara. The men have an even stronger way of showing disbelief and disgust. After listening to something with which he does not agree a Nambicuara will get up, grasp his penis, and slap it sharply against his groin and walk off with a "that for you" look. One might call it a Nambicuara "razzberry." Although some of these personality
181 traits are old and culturally defined, there appears
648 to be little doubt that the Nambicuara have a deep hatred of the white man. They realize that the white men are rich compared with themselves and that contact with the whites has brought diseases which are killing them off rapidly. They realize, too, that both the whites and the Paressí consider them in the lowest category of human beings.

[p.65(A)]

302 Whenever they received good presents such as axes or beads,
[431] they would go to the brook and return with their whole face set
ablaze by the blood-colored paint.

[609] This practice was carried out on outsiders by the Tagnani
as a mark of special esteem. We were all granted this honor in
Três Buritis...

The men do not pluck their pubic or axillar hair; sometimes they even grow a sparse mustache or an even sparser beard. The women depilate themselves completely.

487 [244] The foot paths they use are narrow, similar to cow paths in pastoral regions; in certain areas, the ground is criss-crossed with them. They also make lanes in the woods by cutting branches.

To cross a small river they make a footbridge by cutting down a tree on the bank and guiding its fall in the right direction.

501 If the river is wide, they make a bundle of muriti leaves as a float and allow the current to carry them diagonally across the stream.

[Fig. 36]

481 They are not familiar with the canoe or with navigation; they are good swimmers.

They walk fast. They cover many leagues a day, always at a brisk pace--the "long stride" [marcha em extensão] of the physiologists--with the muscles taut, the body erect.

224 The hunting of big game--tapir, capybara, the Rondon Commission's horses and donkeys--is carried out in groups. For certain species they use special arrows that will be described later.

227 In fishing they do not use fishhooks, but special arrows. (1)
The Tagnani also use a kind of fish trap.

1. According to Ehrenreich the hook is not habitually used by the Indians because of the piranha fish (Pygocentrus sp.) which are so voracious that they do not allow the fisherman to gather in his catch. Nevertheless, a hook made of thorn--the so-called pindá dos tupis [Tupian fishhook]--is found in many areas.

[Fig. 37]

603 On the other hand, grandparents behave toward their descendants
611 so as to show the permanence of the filial line. a14 takes special care of her granddaughters (daughter's daughters), orphaned by the mother, a8 and a9. She feeds them, bathes them, and the baby spends her days near her, and often the nights. When the group travels, she is the one who carries her when she can no longer walk. But above all, when a piece of game has been brought in by a hunter, one sees in the choice of beneficiaries, outlined in the heart of the group, the limits of a unit greater then the conjugal family, and whose reality appears only rarely in daily circumstances.

224 Thus, when a boa sucuri (irɨtasu, a1: Eunectes murinus) has
602 been brought in one day by A17, he gives the tripe to his daughter a19, who passes it on to her sister a22; the latter divides it between a12 and a5 (her "daughters") and reserves a portion for herself; at the same time A17 cuts the body into portions which he gives to A13, A1, A21, and of which he keeps part. Here, the division is almost coextensive with the restricted group. But, in more serious circumstances (1), the division of

1. P. 106 sq., cessation of menses (état de marge).

an irara (inihɨnuklesu, a1; Mustela sp.) by A21 gives rise to the following distributions:

A quarter to a18 (wife's mother);
A quarter to a2 (wife's elder sister);
A quarter to a14 (brother's wife);
A foot to a19 (wife's younger sister);
A half-head to A17 (wife's mother's husband).

[75] He consumes the rest with his wife and baby, and the beneficiaries divide their share with spouse and children. Thus in the heart of the group there is outlined an even more restricted unit:

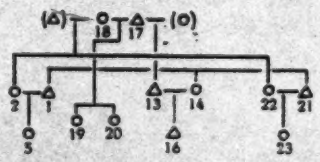

Fig. 17.

535 The circling began at seven o'clock in the evening, with continuous chanting. The girls, not once deviating from their course, left regular marks on the dusty ground which were clearly visible in the moonlight. They seemed always to step in the footprints of the first round. Midnight. Near the fires lit by every family, the old people slept; some muttered and poked the embers which gleamed like scattered rubies. Within the circle, perspiring, covered with dust, more dead than alive, we all joined in the chorus: "Tagnanî-i! Tagnaní-i! Tangrê!"

Thus it went on all night. Whenever one of us fled and repaired to his hammock, two or three big husky fellows would come talking volubly, and drive the deserter back to his place...

[521] Unfortunately the words of those chants were not recorded. We only know the two words cited: tagnani, the name of the tribe, tangre, which means "star." Was this astrolatry? The three central figures of this dance, in the course of which stars were mentioned, brought to my mind [255] the beautiful constellation of Orion with its Três Marias ["Three Maries"--the Belt].

533 I recorded two Cocozu musical pieces which are rendered here [pp. 73-74]. Prof. Astolpho Tavares has transcribed them into musical notation.

[Fig. 34]

The scale [diapasão] of Nambicuara music is about half a tone lower than our normal scale.

The notes used in the recorded pieces are: do^1, mi^{2b}, fa^2, fa^2, sol^2, la^2. Neither re nor si appear.

The recorded pieces are in la flat major shifting to mi flat minor (Recording No. 1), and in mi minor (Recording No. 2).

The musical motifs develop in two-part time.

184 The Serra do Norte Indians present two distinct kinds of social organization. From this standpoint, the Tagnani and Tawite are more advanced than the Cocozu and Anunze.

593 The latter live under a patriarchal regime: the father rules the [511] family, which is often monogamous. The children, after puberty, start new families according to their own wishes [à vontade] and continue to revere their progenitors.

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

tainship is not hereditary; the chief, when old or sick, designates his successor from the ablest men of the group. The chief's authority is slight; it depends wholly on the good will of the family heads.

Relations between neighboring bands are inspired both by fear and by the desire to exchange goods. Warfare, therefore, is closely connected with barter. Groups not acquainted with each other use ritual speech when they meet.

Before starting a war expedition, a divinatory rite is performed with special songs and dances. An arrow is hidden by the shaman, the outcome of the expedition being pressaged by its appearance the following day.

LIFE CYCLE

Childbirth.—After the delivery of a child, the placenta is buried in the bush and both parents are subjected to rigid prohibitions concerning food, the use of ornaments, and social contacts.

Puberty.—The initiation rite for young men consists of piercing their lips and nose and giving them their adult personal name. At her first menstruation, a girl is isolated for several months in a special shelter outside the village, where she is given ritual food by her mother. At the end of the rite, she takes a long bath in the river; this also constitutes the first step of the marriage ceremony.

Both cross-cousin and avuncular marriages (see p. 367), are often planned by parents for their infant children. Marriage is celebrated by festivals, banquets, and dances. The union is pronounced by the chief. Fish and fishing are important both before and during the ceremony.

Separation is frequent, the chief cause being that the man seeks a younger and prettier woman. There is no social sanction of adultery, except that the seducer is advised by his companion to go away for a while so as to avoid the husband's revenge. A murderer also flees vengeance.

Death.—Some groups of *Nambicuara* bury their dead in a circular pit, the corpse being placed in a crouching position. Others leave the corpse to decompose in an elongated ditch and later wash the bones in the river, put them in a basket, and bury them in the village, which is then abandoned. Weapons, implements, adornments, and other property of the deceased are destroyed, but his garden—if he owned one—is abandoned only for a few months. Later anybody may cultivate it.

ESTHETIC AND RECREATIONAL ACTIVITIES

Art.—Most *Nambicuara* groups are completely ignorant of drawing, although some groups decorate calabashes with dots and straight and sinuous lines. These are conventionalized reproductions of realistic designs found among other groups.

291 Around the waist both men and women wear a buritĺ cord; if possible, this string is strung with glass store beads. In addition, men sometimes suspend a lenth of buritĺ fiber from the front of the belt.

302 Men paint their faces with urucú, drawing a band from each side of the forehead down to the chin, another band across the eyes and bridge of the nose, and then a band from under each eye across the cheeks. On the body they draw two stripes, starting from the abdomen up to the nipples and then over to each shoulder. The arms and legs are dotted with red or black spots. The hair is seldom smeared with urucú.

SOCIAL ORGANIZATION

(See chart 13) 1/1

619 The names of the Eastern Nambicuara bands appear to be derived from characteristics peculiar
621 to the band territory. The Waklĺtisu are cayman people for there are many caymans (*waklisu*) in their territory. The Elótasu are open plains people, for they live on the open plain (*toku*) of the upper Camararé River. The Kitánhlu get their name from a small fruit called *tantu*. The Chiwáisu are bee people from the word *waisu*, bee. The Hégndisu are buritĺ fruit (*héeru*) people. Although these bands are not politically united under a single chief, and sometimes even resort to open conflict, they consider themselves a single people, or as Julio phrased it, "We can speak with one another and we came from the same hole in the stone mountain."

619 The origin myth of the Eastern Nambicuara, as
773 it is told among the Waklĺtisu band, can be summarized as follows:

Before the Nambicuara came there were only animals, birds, plants, and beings who could change from animal and bird to human form. At that time the Nambicuara were inside a stone mountain called *yahsindurukaisu*, which is situated north of the telegraph line near Campos Novos (roughly in the center of the territory now occupied by the Eastern Nambicuara). One day the monkeys heard people speaking inside the mountain and went to tell *oklihdilisu* who changed himself into a black and white woodpecker and flew with all his strength against the mountain. When the mountain broke some were killed and some injured but many came out alive. The ghosts of the dead people remained around the mountain where they still are and where all Nambicuara go after they die. The injured people *oklihdilisu* sent into the bush, but the people who were sound of body he put into good clean places and gave them the piuva bow and taught them how

1/1 [CAT. 116, p. 123.-Amhyst] [p. 96 (A)]

619 773 to grow manioc and sweetpotatoes. He also gave them the flute (*udúrhu*), and taught them how to sing and dance. *Ohlihdítisu* is thus the culture hero of the Nambicuara. In human form he looks like a Nambicuara Indian, wears ornaments in his ears, nose, and upper lip and paints himself with urucú. Yet today people no longer see *ohlihdítisu*, for he has gone away. They do not have rituals connected with him, nor do the shamans solicit his aid. But the stone mountain from which the Nambicuara came is still recognized as the place of the dead. On ceremonial occasions the ghosts of the ancestors come to the encampments and villages from the mountain, returning after they have been given food.

622 Although every band has a leader or chief it is not quite certain whether these leaders get their positions through succession or by personal strength and prestige. Julio claimed that he is headman because his father was a headman, but the other members of the Waklítisu band claim that the strongest man is always the leader by common agreement. The Nambicuara appear to value two qualities in a man—"a strong body" and "a strong mouth." The chief is like a tapir (*alúnsu*) which is the strongest of the animals; thus, a chief is called *alunsdidnara*. A shaman gains power by talking or by having "a strong mouth," as the Nambicuara say. The strongest man is one who combines these qualities and is at once a strong man and shaman—he becomes an important chief.

The survival of the band, the Nambicuara believe, depends upon the *alunsdidnara*. He is the hunt leader, the head farmer, the one who organizes trade between the bands, the ceremonial head, the war leader, and the settler of disputes. Every successful chief is supposed to have four wives but otherwise has nothing to distinguish him from the rest of the tribesmen.

619 Relationships between the bands of the Eastern Nambicuara are characterized by intermarriage, trade, occasional joint ceremonies, and wife stealing and consequent armed conflicts. Intermarriage occurs when cross cousins are not available for marriage within the band. The Chiwáisu and Hégndisu obtain pots from the Western Nambicuara in exchange for wax, feather ornaments, beads, and bows and arrows. These pots they in turn exchange with the Eastern Nambicuara bands for knives, axes, and tin cans.

[582] 438 619

When one band wants to meet another in order to exchange goods the approach is made in a very formal manner. The approaching band stops

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

619 438 several hundred yards off and messengers are sent out to arrange a meeting. When agreement is reached the visiting band enters the camp, the visiting chief kneels on one knee and holding his bow and arrows above his head with his right hand he makes a speech extolling the hosts and their goods and depreciating the things which his band has brought. The host then makes a similar speech, and trading begins.

Important items are traded by the two chiefs representing their respective bands, while small items can be exchanged by individual owners. In all cases, however, the technique of trading is the same. If an individual wants an object he extolls it by saying how fine it is. If a man values an object and wants much in exchange for it, instead of saying that it is very valuable he says that it is no good, thus showing his desire to keep it. "This ax is no good, it is very old, it is very dull," he will say, referring to his ax which the other wants. This argument is carried on in an angry tone of voice until a settlement is reached. When agreement has been reached each snatches the object out of the other's hand. If a man has bartered a necklace, instead of taking it off and handing it over, the other person must take if off with a show of force. Disputes, often leading to fights, occur when one party is a little premature and snatches the object before the other has finished arguing. The term "boca forte" (strong mouth) applies particularly to trading, for a man with a strong mouth gets what he wants and convinces the other that he, too, has made a good bargain. This method of trading contrasts sharply with that practiced among the Upper Xingú tribes where each party places a pile of goods opposite the article he wants, usually without saying a word. If agreement is not reached, each one eventually withdraws his goods.

619 583 After a satisfactory exchange of goods the two bands go hunting and prepare a quantity of food and dance as long as the food lasts. During these meetings marriages are sometimes arranged, but more often, when leaving, some strong man will try to steal the wife of some other man. If a fight should occur in which one man is killed the winner will take not only his wife or wives but his children and property as well.

619 Rev. L. W. Buckman gave the following account which reveals something of the tension between

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

619 the bands. In 1937, the Kitánhlu band met a small group of Chiwáisu out hunting and attempted to trade with them. As the Chiwáisu were the smaller group, the Kitánhlu evidently tried to rob them. In the fight several Chiwáisu were killed. These bands did not meet again until 1941, but the Chiwáisu prowled around the Kitánhlu camp stealing what they could and trying to revenge their fallen comrades. In 1941, both bands happened to meet in Campos Novos, and the old quarrel was renewed. In the Chiwáisu camp there was a child which had been born to a Kitánhlu woman married to a Chiwáisu. A Kitánhlu took the child away by force saying that it belonged to his band. The Chiwáisu retaliated by shooting down a Kitánhlu. A fight followed in which the Chiwáisu were driven out after losing several of their band. For several years the Chiwáisu remained away and were attacked by the Saláunsu, a wild tribe living to the north of the Nambicuara. In the last few years, a temporary peace has been arranged by the Chiwáisu bringing presents of wax and honey to the Kitánhlu.

648 Except at telegraph stations, mission stations, and at the two Indian Posts, the Nambicuara have few contacts with their neighbors, the Paressí and Iranxe. The Paressí consider the Nambicuara as their inferiors, and, as far as is known, the two peoples do not intermarry. The Iranxe hold themselves aloof from both tribes.

The efforts of the Serviço de Proteção aos Indios to improve the lot of the Nambicuara have not been very successful. Part of this lack of success is, no doubt, due to the poor agricultural possibilities in the region. The Tolosa Post is situated in a barren region where it is difficult to grow sufficient food to maintain more than two or three families. The Nambicuara visit Tolosa, but after the food supply is consumed they move on. The other factor which makes it difficult to settle the Nambicuara in permanent villages is that they are hunters and shifting agriculturists. Lack of good agricultural land does not altogether explain this nomadic pattern of existence. Like the Caduveo who have excellent farming land the Nambicuara persist in continuing their traditional form of economy.

In contrast to the Paressí, who have become satisfactory employees of telegraph stations, mining camps, and mission stations, the Nambicuara

648 dependent upon the whites for metal tools, guns and ammunition, and feel it necessary to visit white settlements. The Nambicuara are not above visiting white men for treatment of injuries and cases of severe illness.

• 649 The interband relationships of the Eastern Nambicuara, although characterized by tensions and periodic open conflicts, are based on a recognition of common origin, common speech, and a degree of intercourse through trade, marriage, and the performance of dances in common. The relations with the so-called wild tribes to the north, on the other hand, are based on war, not just on raiding for loot and women, but on a war of extermination. Although the bands south of the telegraph line no longer participate in war, the bands north of the line still fight on occasion with their enemies which they call the Salúnsu and which the whites call the Beiço de Pau.

721

726 When preparing for a war the chief of the band takes the men into the woods and tells them that there are bad people to the north which they must kill. Then after singing a war song they set about making many arrows and war clubs. The night before the attack they camp near the village of the enemy. The men paint their bodies with the sap of some latex tree and their faces with urucú and charcoal. They then take leaves and stuff them into any holes in the ground or in trees around their camp. After all the holes are stopped up, they take the skin of an anteater, the skin of a toad, and the leaves of a tree, which are used in preventing rain, and burn them. The stopping of the holes is believed to prevent the enemy from hearing them, the smoke is to blind the enemy's enemies and, also, to make the enemy sleep soundly. The chief remains at this spot and sings all night with the shamans. At dawn the young men approach the huts of the enemy, stand in the doorways and shout, and when the occupants awaken they are shot down or clubbed. No one is spared. They then take whatever they can, burn the houses, and return to the chief and his singing shamans where the loot is distributed among the warriors.

621 The internal organization of the band is based upon kinship and is perpetuated through cross-cousin marriage. One belongs to the band of his or her mother. Julio explained that when the daughter of the wife whom he abducted from the Elótasu reaches puberty she will return to the

534 *kadiwa*, the nose flute, *waiditiwa*, and the five-tube panpipe, *dita*. The nose flute which is about 4 inches in diameter is made by sticking two round pieces of gourd together with resin. Three holes are made on one side, two holes providing finger stops, while air from one nostril is blown across the other. These flutes do not appear to have any ritual significance.

771 In reviewing the religious symbolism of the Nambicuara it appears that the following conclusions can be drawn. The *sikilidiñe* myth explains the origin of the Eastern Nambicuara and their rights to the territory which they now occupy. *Tauptá*, although not the cause of illness, explains why people die. *Tauptá* and *dilawawa* also account for the existence of shooting stars and the presence of rain. *Ulurá* appears to represent the ever-present forces of destruction inherent in the physical environment. Within the framework of these ultimate forces the Nambicuara carry on their struggle for existence assisted by and opposed by the members of their own kind. The security of the band depends upon the close cooperation of the kinsmen acting under the guidance of the chief. The *wãiwãe* flutes provide a supernatural sanction for the powers of the chief and thus help in enforcing and maintaining band solidarity. The flutes, furthermore, are a symbol of the common ancestry of the Eastern Nambicuara in that they relate the bands to the culture hero. The ghosts of the ancestors (*aydakadiwa*), like the living members of the band, must be well-treated in order to avoid danger to children and the perpetuation of the band.

● 619 But actual day-to-day danger to the individual comes from the members of other bands. Disputes over women and quarrels arising from the exchange of goods, as we have seen, lead to bloodshed and death. In the ultimate analysis each [621] band defends itself as a sovereign unit by force. The danger arising from the constant tension and suspicion between the bands is symbolized by the *enãwa* who bring illness, who create the storms which destroy the houses and fields, and who threaten the band with starvation by making hunting difficult. As direct attack by other bands is met with the physical forces of the band, so spiritual attack by the *enãwa* of other bands is met by the assistance of one's own *enãwa*. They help the shamans to draw out the evil objects

●619 which cause sickness, they have given the magical herbs whose smoke blinds the dangerous enemy, and the techniques which will drive away the storms. Thus the shaman operating on a symbolic level continues the struggle for survival which has been defined for the Nambicuara by the nature of their adjustment to their physical environment and their relationships to one another.

THE LIFE CYCLE

BIRTH

833 The Nambicuara recognize sexual intercourse
[842] (winedendilwa) as the cause of pregnancy (kaidilitsa). This act takes place in the woods while the husband and wife are out hunting or collecting, for it is considered improper to have sexual intercourse in public, even at night around the common
756 camp fire. If a shaman should see a couple in
833 sexual embrace while practicing his rites it would spoil his power. Although shamans use a special hut when calling their enemies there is always a chance that they may see a couple in the sexual act, so every effort must be made to avoid this
[834] danger. Shamans themselves abstain from sexual intercourse for 2 or 3 days before getting in contact with the spirits.

843 There appear to be no food taboos surrounding pregnancy among the Wakitisu. The husband continues hunting and collecting as usual, but he must avoid working too hard in the field for
[847] fear of causing his wife to abort. Women do not practice abortion, and the Nambicuara did not mention any medicines used for this purpose.
[832] Honey is considered conducive to sexual vigor and is used by young couples. Childless marriages
[843 586] are attributed to sterility in women, and a man may abandon his wife for this reason.

844 Birth takes place in the house, or in the camp if the family is out hunting. Just before expecting
[824] the birth of a child the expectant mother drinks the juice of certain herbs which are believed to facilitate birth. The husband and two older women assist in the delivery. The woman kneels on the ground and is supported by her husband. The umbilical cord is tied with a certain vine and then cut with a bamboo sliver. Among the Kitaulu it is bitten off by one of the midwives. The placenta is buried at the place of birth and when the umbilical cord dries and falls off, it, too,

[P. 182 (b)]

601 between systems a and c. It constitutes a sort of transition between
582 the simple, symmetrical and harmonious system of the eastern groups
184 and the more subtle and complex structure of the northern system.
This role corresponds well to the respective geographic positions occupied by the different groups.

CONCRETE STUDY OF THE GROUPS

601 The concrete functioning of the kinship systems previously analyzed has been studied in the following groups:

I. Eastern group (dialects a).

●621 (1) Dialect a 1. —A group of 23 individuals composed of six men, nine women, and eight children. This group was found to be temporarily enlarged by the meeting, and sometimes even the temporary combining of bands, whose members present among themselves, and as concerns the first group, analogous kinship relationships. Thus, group (1) was found to be temporarily increased to the point of including 75 individuals (20 men, 30 women, and 25 children).

(2) Dialect a2. —Several small units each including 6 to 12 individuals.

II. South-central group (dialect b1).

A stable group of 17 individuals composed of five men, six women and six children, temporarily increased, by the meeting with relatives, to 31 individuals (13 men, 10 women, and 8 children).

III. Western group (dialect b2).

A group of 12 individuals composed of four men, five women, and three children.

IV. Northern group (dialect c).

A stable group of 34 individuals composed of 9 men, 11 women and 14 children.

128 The concrete study of the groups will be based on the eastern
114 group a1 (restricted) and on the central group b1 (restricted), the only ones with whom we have lived long enough to set forth a psychosociological analysis.

[36] Eastern group, dialect a1: oakletosu (a1); yalhere (b1); yaliririte (c).

621 [161] This group, comprising 23 persons divided into six families, was found in the region of the Papagaio River (Utiarity) upon the occasion of one of its excursions in the nomad period. As we learned later, it was part of quite an important Indian community localized in several villages or camp sites in an unexplored zone of the right bank of the Juruena River, where we went, traveled and lived with them. The dry season and the period of nomadism does not seem to have been the only reason for the isolation of the group; some differences re- [22] lating to command had seemingly provoked a break, grouping a certain number of individuals around an active and ambitious chief. We have, undoubtedly, been called on to play a semi-conscious role in this fight. We shall return to this point when we treat of command. However, the encounters of the group with other bands belonging to the same community have always been cordial. The meeting with a first band approximately restored the population of the winter vil- [161] lage; and the strength of a neighboring village, found later on, increased the number to 75 persons, the largest number of Indians that we saw united in eight months.

As will be seen by the genealogical chart opposite, the restricted group is composed of four generations, the oldest reduced to two individuals, the following being composed of "husbands" and "wives," "brothers," "sisters," "brothers-in-law" and "sisters-in-law." The third and the fourth, finally, constitute a complex mixture of children, sometimes at an early age, considered as "children" or "relatives," and of adults classed as "brothers," "sisters," "husbands," and "wives," and shifted to a generation younger than their normal one because of their situation as children of older brothers.

Before giving several quick pieces of information about each of the members of the group from the point of view of his situation in the kinship system and of his individual psychology, it is necessary to stop for a moment at the question of proper names.

• • • •

551 Proper names are never pronounced among the Nambikwara. A very strict prohibition forbids them and raises a nearly insoluble problem for the notation of genealogies, even though the taboo does not seem to be as rigorous for the dead as for the living. Nevertheless, one [37] never hears a proper name, and individuals call one another

601
621

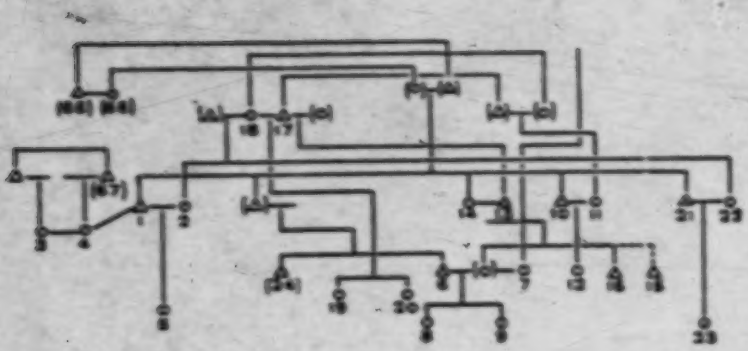

Fig. 11.
Genealogical composition of group a1.

622
115
157 A1. --The chief of the group. He is a man of about 35 years, married to three women: a2, by whom he has a daughter a5, and a3 and a4, both daughters of "sister," without child.

A1 is remarkably intelligent, conscious of his responsibilities, active, enterprising and ingenious. When we went to visit his village, he did not hesitate to follow a new itinerary, unknown to him, because our horses could not pass along the habitual path. And when we arrived at the village, we found the stakes necessary to tie our oxen and horses, which he had had set up by a party sent a few hours ahead of time.

His attitude concerning writing is very revealing. He immediately understood his role of signing (1), and the social superiority which it

531
212

1. The Nambikwara of group a are completely ignorant of drawing, if one excepts a few geometric tracings on gourds. For several days they did not know what to do with the paper and pencils which we distributed to them. A little later, we saw them deeply engrossed in tracing wavy lines. In doing this they were imitating the only use which they had seen us make of our note pads, that is, for writing, but without understanding the purpose and significance.

115 grandchildren and great-grandchildren. He is physically robust,
157 amiable, happy and talkative; very much inclined toward erotic
602 jokes. He gives information willingly, with an extreme good will and a tireless volubility. But his explanations are not always clear, and it is necessary to let oneself be guided by his slightly incoherent fantasy.

115 a18.--About 45 years; wife of the preceding, mother of a2 and
157 a22. She is a serious woman, industrious, devoted to her husband and children. She laughs little, talks to herself, and is always busy with some task. Her bits of information are rare, but solid.

a19.--About 10 years. Daughter of the two preceding. She is a very pretty girl, still a child who yet scarcely shows the first signs of puberty. She has in the group a position as "mother," as does her little sister a20. She is a brutal and sometimes violent child, who adopted towards us an attitude confined to hostility. Her language is crude and she gets involved willingly in the most daring pranks. This attitude is at least partially explained, as will be seen farther on, by her age situation.

[45] a20.--Little girl of 5 or 6 years, sister of the preceding: her contemporaries and even some adults call her "mother." She is perfectly insufferable; pretentious, affected, continually greedy for presents or distractions.

A21, a22, a23.--It is difficult to characterize these three individuals who lived, during nearly the whole time of our visit, in an almost absolute state of silent segregation. The baby a23 is not yet weaned, and the state of couvade was to end at the end of our stay. We shall describe later on the operations which sanction return to communal life. A21, 35 to 40 years, is the brother of A1; a22, about 18 years, the sister of a2. A21 was to die by drowning during one of our absences. The baby is 12 to 18 months old.

621 As we have said before, the restricted group such as it has just been described, is temporarily united with other similar bands, or is temporarily swelled by other family groups. Thus to the 6 "fires"(1)

602 1. As the following analysis shows, the family group--that is the restricted group--of the Nambikwara is rather difficult to define. The empiric notion of the hearth seems to us the most clear and practical. It defines the grouping of the individuals who come together in the evening and sleep around the same fire. In group a1 (restricted) studied previously, there are

602 from this point of view, six fires, namely: I (1 to 5); II (6 to 9); III (10 to 12); IV (13 to 16); V (17 to 20); VI (21 to 23).

621 comprising the stable group are added intermittently:

Fire 7 (24 to 28). Five individuals, including: A24, "son" (of an elder brother) of A1 (20 to 25 years), husband of a25 (18 to 20 years), their baby a26 (about 2 years), the father A27 (about 50 years) of a25, and the brother A28 (about 12 years) of the latter.

Fire 8 (29 to 37). --Eight individuals including: A32, chief of the group comprised of fires 7, 8 and 9. About 40 years of age, asukosu of A1; his five wives, a33, a34, a35, a36, "sisters" of each other (18 to 25 years), and their "mother" a37 (about 40 years), besides the 3 children of this latter, a30 and A31 (8 to 11 years) and a29 (about 2 years).

Fire 9 (39 to 41). --Four individuals, that is, two households, whose kinship relationships are obscure. A38 (about 50), "brother" of a2, and his wife a39 (about 45), "sister" of A1; and A40 (about 30), "brother" of A1, and his wife a41 (about 30), "sister" of a2, the two latter "father" and "mother" of a5.

Fire 10 (42 to 47). -- Six persons, including: A42 (about 30 years old), asukosu of A1; his two wives, the one a43 (about 35 years old), "sister" of A1, and the other a44 (about 18 years old), "niece" of A1, and three children, A45 and A46 (9 to 12) and a47 (2 to 3 years).

[46] Fire 11 (48 to 50). --Three individuals: A48, "brother" of A1 and "husband" of a2 (about 35 years old), his wife a49 (about 35 years old), "wife" of A1 and "sister" of a2. They are consequently "father" and "mother" of a5, and their child a50 is her "sister" (3 to 4 years old).

Fire 12 (51 to 56). --Six persons: A51 (about 40 years old), "brother" of A1 and ajikediu of a2, his wife a52, "sister" of a2 (about 40), and four children, a53 (14 years old) and A54, a55 and A56 (6 to 10 years old).

Fire 13 (57 to 61). --Five persons: A57 (about 45), brother of A69, and asukosu of A1, "older brother" of a2; his two wives, one a58, "sister" of A1, the other a59, his "daughter" (20 to 30 years old), and two children, A60 and A61 (3 and 7 years old), both "husbands" of a5.

Fire 14 (62 to 66). --Five persons: A62 (about 42 years old), asukosu of a1 and akeasukosu of a2, his wife a63, "sister" of A1 and of a58, and mother of a3 (about 40 years old), their child a64 (about 5)

621 and two persons whom A1 calls "father" and "mother", A65 (about 50 years old) and a66 (about 50), who live in the home of their "daughter" a63.

Fire 15 (67 to 70). --Four persons form two households: A67 "husband" of a2 and called asoũnosu by A1 because he is the father of his wife a4, and a68, aseẽtasu of a2, but called aẽinosu by A1 because she is the mother of his other wife. And A69 (about 28 years old), "brother" of A42 and asũkosu of A1, married to a70 (about 25), undetermined parentage.

Fire 16 (71 and 72). --A71 (about 30 years old), "brother" of A28 and his wife a72 (about 20 years old), "daughter" of A13 and a14.

Fire 17 (73 to 75). --A73 (about 30 years old), former husband of a12 whom he abandoned, and his two wives a74 and a75 (20 to 25 years old), "sisters" of a5.

• • • •

RULES OF RESIDENCE

591 621 The phenomena of spatial distribution do not seem to have special significance in the essentially nomadic groups. Nevertheless, we shall give the plan of distribution of the families in the nomadic camp (chart I), and in the winter village (chart II) for the restricted group, and the plan of distribution of the families or of the fires in semi-permanent camp for the most numerous combination (chart III). [47]

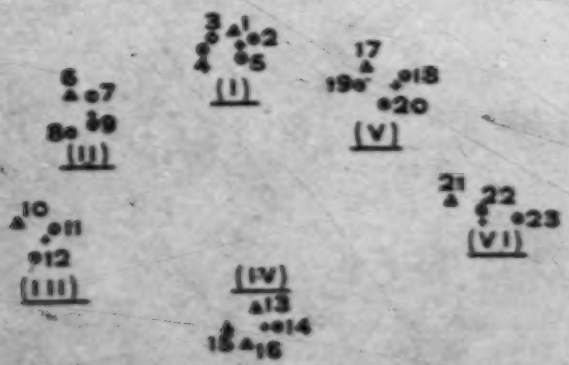

Fig. 12. --Placement of fires (+) and of family groups (▲ : man; ○: woman) in the nomad encampment.

591
●621

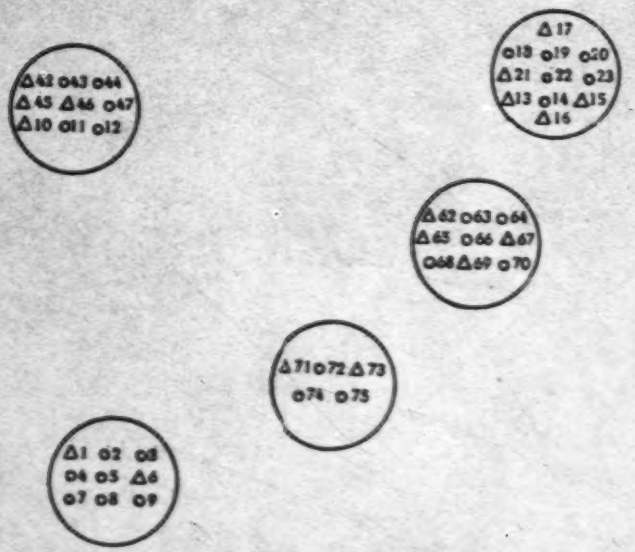

Fig. 13. --Grouping of families in the huts of the winter village.

The examination of these charts calls for several remarks.

(1) The nomadic camp generally obeys fixed rules for the distribution of individuals around the "fires," but not for the distribution of the "fires" in space. Fires 1 to 6 are not distributed in [48] the same way in the nomadic camp (I) and in the general camp (III). In fact, in the latter case, the families arrived one after the other, traveling in groups of two or three, or separately, and came to occupy the available sites. Nevertheless, when the restricted group travels in a single block, its camp is generally in conformance with the distribution given in chart I, which reproduces a camp maintained for one month.

(2) The distribution of the camp fires does not reproduce the distribution of families in the huts of the winter village. However, one will observe that the members of fires 1 and 2, who occupy one and the same hut, camp side by side in chart I, and around the same fire in chart III [49] (but, at this moment, A6 is absent and his family rejoins the fire of his "father"). In the same way, fires 4, 5, and 6, placed side by side in chart I, live together during the winter camping (chart II); but in this latter case, there is a complete separation at the time of the general meeting. It is true that at this moment, A21 has just died, his wife and his baby have rejoined the maternal

[I refers to Fig. II and III refers to Fig. IV. --Translator]

591
621

[361]

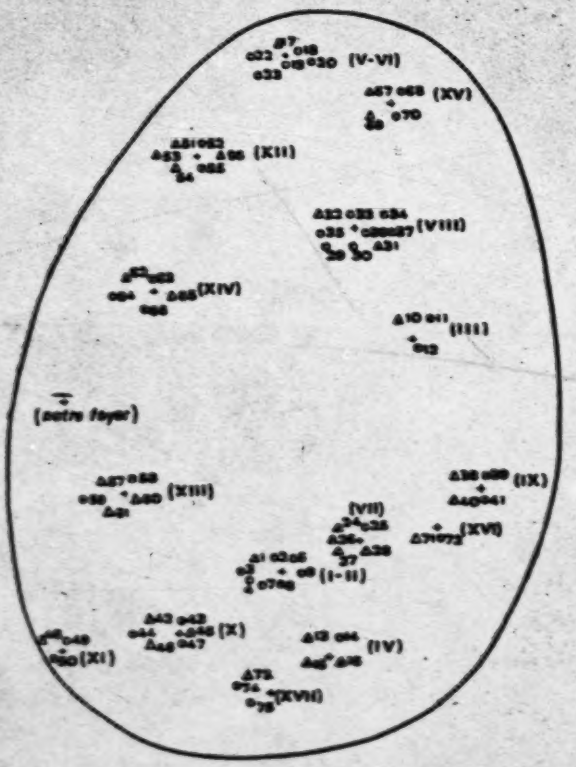

Fig. 14. --Distribution of Families in Temporary Residence.

fire, and the group of six persons has arrived late at the reunion, after an isolated trip. Fires 16 and 17, united at the winter camp (II), are completely isolated in camp (chart III); the same for fires 14 and 15 and for fires 3 and 10.

[29] (3) Since several families join around the same fire, it does not seem possible to deduce any rules of residence, which seems to confirm the impossibility of obtaining from the informants a clear answer to the question of whether the young couples establish themselves separately after marriage, or remain near the parents of the wife or the husband. In two cases, we see the daughters rejoin their parents fire: a12, abandoned by her husband, and a22 at the time of her widowhood. During the winter camp, the household of fire 4 resides with the parents of the husband; and household 6 with the wife's parents (fire 5 in the two cases). Likewise at this time, fire 2 is installed in the hut of the husband's "father." Finally, in two cases, one sees parents, unfit for the economic battle because of age or widowhood, installed at their daughter's fire, as A65 and a66, and

591 A27 with his son A28. All this offers a very confusing spectacle,
621 and it is not the only case among the Nambikwara where the sociologist feels discouraged from deducing fixed rules. In a case such as that of the rules of residence, the answers of the Indians and the study of the facts might lead one to conclude that these rules do not exist, but such a conclusion should not be accepted except with the most extreme reservations. We shall be forced from time to time to insist on the fact that, in a society whose demographic base is broken up in a very short space of time, the traditional rules might be clouded by the necessity of solving cases which have become individual and concrete by force of things. Among peoples who live under such strenuous conditions, a certain distribution in elementary associations of individuals of different sex and age might be decisive to assure the means of existence for each of them. Many family combinations seem thus to result from immediate necessities. It could also be that the rules exist, and are based on sociological
181 reasons which escape us. A society made up of wandering bands which one never finds again with the same composition after a few weeks interval because certain members or families have left it, while others have come to join up; whose camps never offer the same exact distribution from day to day; whose winter huts are most
[609] often destroyed during the dry season; who flee one another, chase one another off, attack each other in frequent conflicts, and about which the least one can say is that in periods of peace, they avoid one another; whose [50] material culture, reduced to the strict minimum, puts into use only rudimentary techniques where social differentiations cannot be expressed; such a society offers to the sociologist ever-changing material, that is fleeting and often cannot be grasped. In very numerous cases, its laws of organization escape analysis and, supposing that they exist, could not be discovered except on the occasion of an extended visit, not only during the period of the nomadic life, but also of the sedentary life.

621 Central and southern group, dialect b1: tarũnde, maimãde (b1); mamãindeti (c) oãindesu, nikõdetosu (a1).

We have divided the encampment of the two groups b1 and c. The latter is composed of 17 persons divided into five fires. Both
[101 were wandering in the zone of the line of the separation of waters
131] between the Tapajoz and the Madeira (Vilhena Rivers). We shall

621 We shall comment later (1) on the complex motives that might have induced

1. Cf. p. 77.

[197] these two bands, speaking different dialects and who were not even capable of understanding one another without an interpreter, to practically merge. It seems that group b1 was composed of the rare survivors of a formerly important formation now disappeared, living previously in two distinct groups, around the sources of the eastern tributaries of the Roosevelt River. We have already tried to calculate these losses, resulting from recent epidemics (2). Group c had,

2. Cf. above, p. 6.

[578] without doubt, gone through the same hardships. Moreover, its position had been compromised by antagonisms with other bands rising from the same dialect, and who had formerly been their allies. A visit, with a commercial goal, of related Indians originally from the south (members of the group known by the name of Kabisi) must have raised the forces of group b1 to 31 persons for several days. Here is its composition at this moment:

621 115 157 622 601 Fire 1 (1 to 7). --The family of the chief of the band. The chief, B1, is 30 to 35 years old, and one of the most intelligent Indians whom it was our privilege to encounter. But he is intelligent in a way very different from A1. The latter is prudent and very resourceful, always meditating some political combination. On the contrary, B1 is not a man of action, but rather contemplative, with a charming and poetic spirit, and rich sensibilities. He is fully conscious of the inevitable decadence of his people, and this conviction often shades his words with a subtle tint of melancholy:

(4) joãmditnʔẽ njãnajne heni niho ãmednjẽn. (b1)

"I also did the same thing, now it is finished," [51] he says, remembering happier days when his group, far from being reduced to a handful of individuals incapable of keeping alive their traditional customs, was comprised of several hundreds of participants faithful to all the manifestations of the Nambikwara culture. His curiosity toward our customs and towards those which we had been able to observe in other tribes is just as great as ours. With him, ethnographic work is never unilateral. He conceives of it only as an exchange of information, and what we bring him is always very welcome. Often

[77] he even asks us for—and preserves carefully—drawings representing

621 feather ornaments, hair styles, arms, such as we have seen among
115 neighboring or faraway peoples. Did he entertain the hope of per-
157 fecting the material and intellectual equipment of his group thanks
622 to this information? It is possible, even though his dreamy tempera-
177 ment hardly ever drives him to realizations. However, one day when
601 we were interrogating him concerning the Pan pipes, to verify the
area of diffusion of that instrument, he answered that he had never
[531] seen any, but that he would like to have a drawing (different from
group a, group b does not have real pipes of Pan, but instruments
made of two or three tubes of equal length and giving approximately
the same note, tied together with cotton thread and wax). With the
aid of our sketch he succeeded in making a crude but usable instru-
ment.

621 B1 had two wives: b2, about 25 years, mother of two little
601 girls of 5 to 7 years, b4 and b5; and b3, older than he (about 40
years old), mother of a boy of 7 years, B6, and of a girl of 9 years,
b7.

Fire 2 (8 and 9). --A son of a deceased brother of B1, whom the
latter then calls "son" (about 25 years old), and his wife about 18,
sister of B13; no information about the father and mother.

Fire 3 (10 to 12). --B10 is a brother of B8, and B1 calls him "son"
also. His wife, b11, of undetermined parentage, is about 20 years
old, and his daughter b12 about 6.

Fire 4 (13 and 14). --This household presents the only sure case of
oblique marriage in group b1. B13, about 25 years, married a girl
of 16 or 17, b14, daughter of a dead son of the dead brother of B1;
he calls her then, as seen before, tasuite.

Fire 5 (15 to 17). --These three individuals are the last survivors
of a related group destroyed by an epidemic. After the disaster,
they joined the band of B1. B15, about 35 years, is the brother of
b2, thus tarute of B1. His wife, the same age, b16, is a sister of B1,
thus ndedere of b2. Their son, B17, is about 5. The daughters of
B1 call him (B17) "husband," and he calls them "wives."

621 [52] The visitors. --They came from the region lying between
574 the sources of the tributaries of the left bank of the Juruena and of
601 those of the right bank of the Guaporé. All were related to their
hosts, and were distributed among three generations. The oldest was
comprised of three individuals: B18, about 50 years old, father of
B21, B25, B27, and B29; his wife b19, the same age, paternal aunt
of B1; and the brother of the wife, B20, 40 years. Besides the
children of B18 already mentioned (from 20 to 30 years old), the next

621 574 601 generation is composed of b26, wife of B25 (about 20 years); of the husband of b29, B28 (about 25); of the wife, b22, of B21 (same age); of his brother B24 (20 years), both children of a deceased sister of B18; and of a widower of about 40 years, B30, brother of B15 and of b2, who had been married to a sister of B1. The young generation is represented by only two children, b23, about 7 years, daughter of B21 and b22, and b31, about 10 years, daughter of B30, mother dead. For the whole picture of genealogical relationships, the reader should refer to Figure 15.

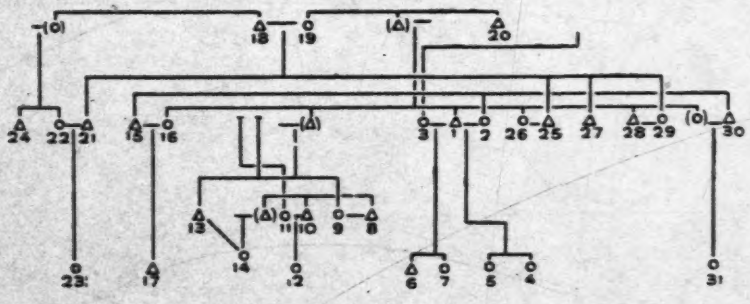

Fig. 15.

601 621

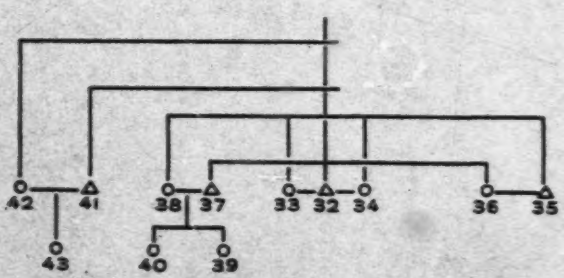

Fig. 16.

621 601 [53] Western group, dialect b2: tajate, lakõnde (b1/2); soyaĩnte (c).

We shall limit ourselves to giving the genealogical scheme of the composition of this little group (Figure 16), found, only for several days, toward the line of the division of the waters which separate the basins of the Roosevelt and the Gi-Parana (Tres Buritis). Its members seem to be the survivors of a formerly important group, the tajte.

Northern group, dialect c: sabane (c); tamajnde (b1/2); toãtesu (a 1/2).

[197] We have not been able to establish the genealogical composition of this group for reasons of linquistic difficulties (dialect c does not seem to spring from the same family as the others) and because of the consecutive impossibilities which we encountered in determining the true position in the system of individuals designated by the same term. We shall thus content ourselves with an analysis by households.

Fire 1 (1 to 3). --C1, about 30 years, and his wife c2, 25 years; he, "brother" of C6, she, "daughter" of c23; their son, C3, is about 10 years old.

Fire 2 (4 and 5). --C4, 40 years, is the younger brother of C20 and of c23; his wife c5, 25 to 30 years, is called "wife" by C6, "older sister" by c21, and "daughter" by c23.

Fire 3 (6 to 10). --We have already analyzed (1) the kinship

1. Pp. 33 to 35.

situation of C6, of his wife c7 (both are 30), and of their children c8 and c9 (6 to 8 years); the younger brother of the wife, C10, about 10 years, lives with them.

Fire 4 (11 to 14). --C11 is 50 odd years old; he is called "elder brother" by C6, C4, C15, C20, and c23; his wife c12, about 35 years, is "daughter" of c23; the young brother of the latter, C14, about 17 years, unmarried, lives with them as well as their daughter of 7 years, c13.

Fire 5 (15 to 18). --C15, about 30 years, is called "younger brother" by C20 and c23; his wife c16 is "daughter" of c23; she has a young brother C17, about 12 years, and a baby of some 20 months, c18.

601 Fire 6 (19 to 22). --The chief, or rather, it seems, the shaman of
621 group c, is 30 to 40 years old, "brother" of c23. His dispositions are
[756] friendly and mysterious. We shall encounter him farther on (2). He

2. P. 103.

has two wives, c19 and [54] c21, very pretty girls of 17 or 18 years, "sisters" of the dead husband of c23. Here we have, then, a good example of sororal polygyny. The second woman has a little boy of 3 years, C22.

Fire 7 (23 to 25). --The woman, c23, is over 40; she is a widow and seems to enjoy great consideration. Her numerous "brothers" provide for her as well as her children, and like C20, she is apt to receive supernatural revelations (1). She has a son, C25, about 14

1. Cf. p. 101.

years old, and a daughter, c24, about 10. Concerning them, refer to page 34.

Fire 8 (26 and 27). --A young couple of about 18, whose parents must be dead and whom the elders of the group call "grandchildren."

Fire 9 (28 to 30). --C28, about 25 years, is a "son" of C6; his wife, c29 is older than he (over 40); she is called "daughter" by c19 and c21, although they are by far younger than she; her daughter c30 is about 2 years old.

Fire 10 (31 to 33). --c32, about 40 years old, is a younger sister of c23; she has two daughters: the eldest, c31, about 17, is married; the younger, c33, still a baby. The husband and her son-in-law are absent; they are said to be on a trip together. The group sees to the needs of the two women.

It is suitable to add a visitor to this list, C34, about 30 years old.
[574] He is the brother of c12 and, during his stay, he receives the hospitality of household number 4.

RELATIONSHIPS BETWEEN INDIVIDUALS

Husbands and Wives

593 To understand well the attitude of the two sexes as concerns one another, it is indispensible to keep in mind the fundamental character

605 But the relationship of "cross-cousins potentially or effectively allied by the marriage of their sister"--which seems to be the most adequate equivalent of the [77] term tarũte--can be extrapolated largely above and beyond family relationships. In certain cases, it is used to create, among individuals without relations, original ties whose role is to fuse, indirectly, in a same family group, groups formerly heterogenous. It was noted 621 at the beginning of this work (1) that the central and southern 182 184

1. See p. 6.

groups have decreased quite considerably owing to the epidemics of the last fifteen years. Some of them have seen their power reduced to such a degree that the following of an independent social existence in such conditions might seem an illusory objective. Certain ones then grouped together in the hope of reconstituting a workable unity. Thus it is that when we found them the group designated under the title b1 (restricted), comprising 18 persons, and group c, comprising 34 persons, lived together, under the authority of their respective chiefs, but these working together. It is to be presumed also that the decrease in number was not the only reason for that alliance, and that group c represented a fraction of a more numerous group which it had been forced to flee for an undetermined reason. It probably sought greater security in the nomad's life shared with group b1. Some rather obscure events (2) which occurred

2. See p. 103.

during our stay let us glimpse the political background whose details we do not know. Whatever the case may be, the two groups traveled together, camped at the same times, but without mixing their fires, the constituent families forming two adjacent agglomerations. The most surprising trait of this or- [91] ganization was that the two groups did not speak the same language and could not communicate with one another except through one or two individuals belonging to each group who acted as interpreters. Notably, no direct communication existed between B1, chief of the Tarundé, and his colleague C20, chief and shaman of group Sabané. In fact, if there is

In fact, if there is
621 no doubt concerning the close affinity of dialects a1, a2, b1 and b2,
[197] which do not differ among themselves except as the derivations
182 of a mother language, dialect c offers, as regards the preceding,
184 such profound differences that one does not know if one is in the presence of a language of the same family. In any case, in whatever way linguistic study might resolve this problem, it can be reasonably set forth. We do not hesitate, nevertheless (and in spite of anthropological differences), to place group c in the cultural family of the Nambikwara, because of the identity of material culture and way of life, and especially because of the psychological attitude of groups b1, b2 and c as regards one another, who ostensibly recognize their community.

621 The union of the two groups posed a problem, that of the
605 nature of the relationships which would go on between their respective members. This problem [78] has been resolved by the recognition of all male members of group c as being "cross-cousins"—tarûte, of all the adult males of group b1, and of all the adult males of group b1 as being the jôpa (corresponding to "cross-cousin" in the vocabulary of parentage of group c) of all the adult males of group c. The result, consequently, is that if all the husbands of the two groups are "brothers-in-law among themselves," all the "wives" of a group are "sisters" of the husbands of the other, and all the children of both sexes, in a group, potential husbands or wives of the infants of the other group belonging to the opposite sex. The blood fusion of the two groups is thus definitely assured for the following generation. Here is a type situation which one finds thus realized:

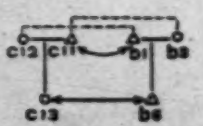

Fig. 18.

The systematic character of this solution is not doubtful. The informants belonging to group b or to group c, when we interrogated them concerning their kinship relationship regarding a male adult of the allied group, never furnished us with a special answer concerning the considered case, but remarked

621 instead that all the Sabané men were for them tarûte, or that all
605 the Tarundé men were jôpa. As a general rule they did not take the trouble to formulate relationships between women, between children, or between adults and children. In all these cases, except several occasions when the deduction was specifically made, they gave as an answer the name of the group: it is called "Sabané" or "Tarundé." It is thus in the function of the relationship of tarûte or jôpa (asûkosu, al) that the system has been conceived and applied.

This fact merits attention, for if the goal of the system were only to assure intermarriages, one could proceed in two other ways, or, more exactly, give two other interpretations for the same solution; one consisting of posing all the women as "sisters-in-law," the other treating all the men of one group and all the women of the other, respectively, as being among themselves "brothers and sisters," and the result would have been the same. Of course, these two aspects are implied in the proposed solution, as its correlaries. However, the solution itself, which could be presented in three different and equivalent ways, has actually been thought, in preferential fashion, to be in the function of the relationship existing between the male and allied collaterals. Several suggestions should thus be examined.

601 [79] Of the three possible solutions, two implied taking the women into consideration, one only was purely masculine, and it is that one which has been chosen. One must not be astonished if, as we suppose, the problem posed was a political problem, thus arising from command, exclusively exercised by the men, and not by a normal play of filiation, which seems rather a
[582] matter of female lineage (1). Although in a simple system of

1. See p. 39.

marriage between cross-cousins, as is the Nambikwara system, the "brothers-in-law among themselves" can be as easily the fathers of the mothers as the fathers of the fathers, this choice gives to the Nambikwara sociology, which to the present time we have had trouble characterizing from this point of view, a decidedly masculine tint, or rather, it bears witness of a tendency in that direction, at the same time that it constitutes the first outline of a social system coming to superimpose itself on the purely family structures to which we have been limited

622 discovering grains or fruits, [87] groves of piquy (a type of fir), of
623 caju (Anacardium sylvestre), the heads of streams frequented by small game, where to lead his group, always searching for means of subsistence. His role is also that of maintaining internal discipline and of opposing the bad intentions of recalcitrants:

29. odnanjenoutonje hutonto igalagatjene (b1)
Lazy one, I order you, that is enough, to work!

The only sanction at his disposition is that of obtaining the agreement of his companions to expell one who has become guilty of a fault (1) or who shows himself to be rebellious to collective life.

1. Cf. below, p. 111.

But that is only possible in the case where a single member of the group shows lack of discipline. The chief should show a continual talent which is more closely related to electoral politics than to the exercise of power, to maintain his group, and if possible, to enlarge it by new adherents. The nomadic band in fact represents a fragile
622 unit. If the authority of the chief becomes too demanding, if he
621 monopolizes too great a number of women, if he is not capable in periods of need of resolving the food problems, discontent is created, individuals or families break away, and go to attach themselves to a related band whose affairs seem to be better conducted--better nourished thanks to the discovery of a hunting or collecting site, or richer because of barter with neighboring groups, or more powerful after victorious wars. The chief then finds himself at the head of a too restricted group, incapable of facing daily difficulties, or whose women are exposed to being carried off by stronger neighbors, and he is obliged to renounce his command in order to join a more happy faction with his faithful followers; the Nambikwara society is thus in a state of perpetual flux. Groups form, are broken up, grow and disappear and, in several months' time sometimes the composition, number and division of bands become unrecognizable. All of these transformations are accompanied by intrigues and conflicts, by rises and falls, the whole being produced at an extremely rapid rhythm.

622 In exchange for the authority which they recognise in him, his companions are very demanding in regard to their chief; and if a decision made by him places the group in some difficulty, he is left alone to find means of surmounting it. We remember a trip undertaken by mutual consent, rendered more difficult than had been thought by the necessity of discovering a new itinerary along which our mules

SP17 Nambicuara SP17

Gardening exists only during the rainy season and does not free the Nambikuara from wandering during the seven months of the dry season, looking for wild roots, fruits and seeds, small animals such as lizards, snakes, bats, spiders and grasshoppers and, generally speaking, anything which may prevent them from starving. As a matter of fact, their geographical surroundings, which are located in the northwestern part of the state of Mato Grosso and include the headwaters of the Tapajos, Rio Roosevelt and Rio Gi-Parana, consist of a desolated savanna with few vegetal resources and still less game.

Had I approached my subject from a point of view other than the one outlined above, I could not have avoided a long discussion in South American cultural history, aimed at clearing up this apparent primitiveness, on the question as to whether the survival of early conditions of life in South America is genuine or whether we should consider it as a more recent—although undoubtedly pre-columbian—result of culture clashes and processes of acculturation. Whatever the answer may be, it cannot substantially change our problem: whether tarriant or recessive, the Nambikuara society *functions*, in the present, as one of the simplest forms of human society to be conceived. We shall not seek information from the particular history which kept them in their exceptionally crude organization or brought them back to it. We shall only look at the experiment in social anthropology which they now enact under our very eyes.

This holds especially true in respect to their social and political life. For if we do not know what was the material culture of the Nambikuara forty years ago (they were discovered only in 1907), we do know that their numbers became tremendously reduced after their contact with white civilization. General (then Colonel) Candido Mariano da Silva Rondon, who discovered and studied them, first stated that their number was about 20,000. This was around 1915. I take this figure as greatly exaggerated, but even if reduced by one half, it considerably exceeds the present number which is hardly more than 2,000. Epidemics have taken care of the difference. What does this mean, from the point of view of our study? During the dry season, the Nambikuara live in nomadic bands, each one under the leadership of a chief, who, during the sedentary life of the rainy months, may be either a village chief or a person of position. General Rondon wrote that, at the time he was exploring the country, it was not rare to see bands averaging two or three hundred individuals. Now, sixty or seventy

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

621 people are seldom met together, the average size of the bands being twenty individuals, women and children included. This demographic collapse cannot possibly have taken place without affecting the structure of the band. But here, too, we do not need to concern ourselves 121 with such questions as the type of political organization in earlier times. It is probably more difficult to understand Nambikuara sociology now than it was thirty years ago. Perhaps, on the contrary, the much reduced Nambikuara band offers, better than in the past, a privileged field for a study in social anthropology. My contention is that, precisely on account of its extreme impoverishment, Nambikuara political structure lays bare some basic functions which may remain hidden in more complex and elaborate systems of government.

[361] Each year, at the end of the rainy season, that is, in April or in early May, the semi-permanent dwellings laid in the vicinity of the 621 gallery-forest where the gardens are cleared and tilled, are abandoned and the population splits into several bands formed on a free choice basis. Each band includes from two to about ten families usually tied by kinship. This may be misleading when a band is met, for one easily gets the impression that it is formed as an extensive family. It 601 does not take long to discover, however, that the kinship tie between [602] two families belonging to separate bands may be as close, and eventually closer, than between two families inside the same band. The [512] Nambikuara have a simple kinship system based on cross-cousin marriage and the subsequent dichotomy between "cross" and "parallel" in every generation. Therefore, all the men in one generation are either "brothers" or "brothers-in-law," and men and women are to one another either siblings (true or classificatory) or spouses (true or classificatory). Similarly, children are, in relation to the adults, either sons and daughters (true or classificatory) or nephews and nieces, which is the same as actual or potential children-in-law.[1] As a result, there is no great choice of terms to express kinship, and this explains why kinship inside the band may appear closer than it actually is, and kinship between people belonging to different bands more remote than shown 602 by genealogies. Furthermore, a bilateral cross-cousin marriage sys- 621 tem functioning in a relatively small tribe must produce a progressive narrowing, and even a multiplication, of the kinship ties between any two individuals. This is a supplementary reason preventing family

[1] C. Lévi-Strauss. "The Social Use of Kinship Terms among Brazilian Indians." American Anthropologist, 45 (3) 1943.

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

relationship from becoming really operative in the constitution of the band. It can be said that, inside the band as well as between the different bands which are the offspring of the same temporary village, everybody is everybody's kin, in pretty much the same fashion.

Why then the splitting-up process? Two different considerations must be brought forth to answer this question. From an economic point of view, the scarcity of wild food resources and the subsequent high square-mileage needed to feed one individual during the nomadic period make the division into small bands almost compulsory. The real question is not why there is a division but rather on what basis it takes place. I have said that this is done by free choice, but this freedom is not arbitrary. There are, in the initial group, several men acknowledged as leaders (who likely acquired this reputation from their behavior during the nomadic life) and who make the relatively stable nuclei around which the different aggregates center. The importance, as well as the permanence of the aggregate through successive years, depend largely upon the ability of each of these leaders to keep his rank and eventually to improve it. Thus, it may be said that leadership does not exist as a result of the band's needs, but, instead, that the band receives its shape, its size, and even its origin, from the potential leader who antedates it.

There is, however, a continuous function of leadership, although not permanently assumed by the same individual. Among the Nambikuara, chieftainship is not hereditary. When a chief grows old, or is taken ill, and when he does not feel able to fulfill his heavy duty any more, he himself designates his successor. "This one—this one will be the chief . . ." he says. It seems likely that this autocratic power to insure one's own succession is more apparent than real. We shall emphasize later on the small amount of authority enjoyed by the chief and, in this case as in many others, the final decision is probably preceded by a careful survey of public opinion, the designated heir being, at the same time, the one with the greater support from the members of the band. The appointment of the new chief is not only limited by the wishes or disapproval of the band; it needs also to correspond to the plans of the individual to be chosen. Not seldom, does the offer of leadership meet with a vehement refusal: "I don't want to be the chief." Then a new choice must be made. As a matter of fact, chieftainship does not seem to be coveted by many people, and the general attitude of the different chiefs I happened to know was less to brag about their

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

are to be cultivated; and, generally speaking, he will organize the occupations according to the seasons' needs and possibilities. 622

These rather versatile duties, it should be pointed out from the start, are not facilitated by any fixed power or recognized authority. Consent is at the origin of leadership, and consent, too, furnishes the only measure of its legitimacy. Disorderly conduct (according to the native standards) and unwillingness to work on the part of one or two discontented individuals may seriously jeopardize the chief's program and the welfare of his small group. In this eventuality, however, the chief has no coercivitive power at his disposal. The eviction of the bad people can take place only in so far as the chief is able to make public feeling coincide with his own opinion. Thus, he must continuously display a skill belonging more to the politician trying to keep hold of his fluctuating majority than to an over-powering ruler. Furthermore, he does not only need to keep his group together. Although the band lives practically alone and by itself during the nomadic period, the existence of the other bands is not forgotten. It is not enough to do well; the chief must try—and his people count on him for that—to do better than the others. [627]

No social structure is weaker and more fragile than the Nambikuara band. If the chief's authority appears too exacting, if he keeps too many women for himself (I shall later analyse the special features of the chief's polygamy), or if he does not satisfactorily solve the food problem in times of scarcity, discontent will very likely appear. Then, individuals, or families, will separate from the group and join another band believed to be better managed. For instance, this band may get better fare from the discovery of new hunting or gathering emplacements; or it may have become richer in ornaments or implements, through trade with neighboring groups, or more powerful as a result of a successful war expedition. The day will come when the chief finds himself heading a group too small to face the problems of daily life, and to protect his women from the covetousness of other bands. In such cases, he will have no alternative but to give up his command and to rally, together with his last followers, a happier faction. Therefore, Nambikuara social structure appears continuously on the move. The bands take shape, then disorganise, they increase and they vanish. Within a few months, sometimes, their composition, number and distribution cannot be recognised. Political intrigues within the same band and conflicts between bands impose their rhythm upon these fluc- 621 627

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

[621] 622 tuations, and the ascent or decline of individuals and groups follow each other in a rather surprising manner.

How will the chief be able to overcome these difficulties? The first instrumental force of his power lies in his generosity. Generosity —an all important feature of chieftainship among most primitive peoples, especially in America—plays an outstanding part even on those crude cultural levels where worldly goods are limited to the most primitive weapons and tools, coarse ornaments made of feathers, shells and bones, and raw materials, such as lumps of resin and wax, hanks of fiber and splinters of bamboo for arrow-making. There cannot be great economic distinctions between families each of which can pack [462] all of its belongings in the baskets carried along by the women during [556] the long travels of the dry season. But, although the chief does not seem to fare better, in this respect, than the others, he must always have at hand surpluses of food, tools, weapons, ornaments which, while being small indeed, acquire great value because of the scarcity which is the prevalent condition. When an individual, a family or the band itself needs or covets something, the chief is called upon to secure the desired article. Generosity is the quality, much speculated on, which is expected of a new chief. Generosity is the string constantly struck which makes the general consent to one's leadership sound clear or out of tune. There is little doubt that, in this respect, the chief's ability to give is exploited to the utmost. Band chiefs used to be my best informants, and, well aware of their difficult position, I liked to reward them liberally; but I seldom saw one of my many gifts remain in their hands for more than a few days. Each time I took leave of a band, after a few weeks or a few months, its members had time to become the happy hoarders of axes, knives, beads, and so on. As a rule, however, the chief was exactly as poor as at my first arrival. Everything he had received from me (and this was considerably more than the average) had already been squeezed out of him. This collective greediness not seldom drives the chief to an almost desperate position; then the refusal to give plays about the same part, in this primitive democracy, as the threat to resign followed by a vote of confidence in a modern parliament. When a chief reaches the point where he must say: "To give away is over! To be generous is over! Let another be generous in my place!", he must, indeed, be sure of his power and prestige, for his rule is undergoing its severest crisis.

Ingenuity is but the intellectual form of generosity. A great deal

missaries had not yet learned enough Iranxe to make working with informants possible.

As all of the following information, unless otherwise specified, relates to the Wakitiau band, a short description of this band is in order. Today the band consists of 18 individuals, of which Julio is the chief. About 5 years ago, before a measles epidemic decimated it, the band was roughly twice the size it is today. Julio is a man of middle age, has three wives and two children, and probably holds his leadership by being the strongest and ablest man in the band. Except for one of Julio's wives and her daughter who are Elóitaxe, the members of the band are Wakitiau and related to one another. Julio took the Elóitaxe woman from the Elóitaxe band by killing her husband. He claims he did this because the Elóitaxe chief stole one of his wives some years ago. He claims he is going to steal another wife, for every chief is supposed to have four. Only three other men, Martin, Marciano, and Joaquin, are married, each having one wife. The remaining four are either widowers or as yet unmarried.

Of all the Indians which I have visited in Mato Grosso the members of this band of Nambicuara were the most miserable. Of the eight men, one had syphilis, another had some kind of infection in his side, another had an injured foot, another was covered with some kind of scaly skin disease from head to foot, and another was deaf and dumb. The women and children, however, appeared to be healthy. Owing to the fact that they use no hammocks but sleep on the ground, they are always covered with dirt. On cold nights they remove the fires and sleep in the warm ashes. The Wakitiau wear clothes only when they are given by the missionaries, who ask that they be worn. Their distaste for bathing permits not only a covering of dust and ashes to accumulate on their skin and hair but also particles of decayed meat and fish, which, combined with stale sweat, makes proximity to them rather distasteful. They also appear to be heavily infected with internal parasites, for their stomaches are distended and they are continually passing wind. On several occasions when a number of them had crowded into the small room we used for working we had to cease work in order to air the room.

In their manners the Nambicuara also contrast sharply with the other tribes I visited. The

101 are their enemies whom they call the Salumã or Saikoré, probably the Apiaka whom the local Brazilians call the Beiço de Pau, owing to the fact that they wear labrets.

[17] Linguistically the Nambicuara are divided into an Eastern and a Western group. Both the 13 Eastern and Western Nambicuara, in turn, are 101 dialectally subdivided. The Eastern group is made up today of four bands: the Eléitesu situated south of the telegraph line on the Rio Formiga, a tributary of the Sutina River; the Wakítesu just north of the telegraph line on the Juruena River; the Kitánhlu south of the telegraph line on the Camararé River; and the Chiwétesu now including the Hágudesu north of the telegraph line on the Camararé River. The Eastern bands thus extend on both sides of the telegraph line from Utiarity to Vilhena. The Western Nambicuara are composed of at least three bands, the Wáindesu on the Kabíxi River (a tributary of the Guaporé River), the Támdisú and Sokóndesu on the upper Roosevelt River. The above-mentioned names were given by Julio of the Wakítesu band. The different subdivisions of the Nambicuara have been called various names in the reports. As far as concerns the Eastern Nambicuara the following names appear to be synonymous. For instance, the local Brazilians call the Wakítesu, Eléitesu, and Kitánhlu the Iriteo; these names appear to cover at least part of the people whom Roquette-Pinto called the Kokozú. The combined Chiwétesu and Hágudesu are called the Mandeos by the local people, and the Anunzé by Roquette-Pinto. Or, to put it another way, the Eastern Nambicuara of the literature are divided into the Kokozú and the Anunzé by Roquette-Pinto, and into the Iriteo and Mandeos by the Brazilians who live in the region.

101 The confusion in band names in all probability
• 62 has arisen from the changes in band organization in the last half century. Fifty years ago the Nambicuara were far more numerous than they are today, and no doubt the number of bands was also greater than today. The extension of the name of an important band to lesser bands is thus quite
62 conceivable. The economy of the Nambicuara appears to indicate that there are maximum and minimum limits to the size of a band. If it grows too large for a given area to support, it will break up, or if it becomes so small that its economic

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

621 security and marital possibilities are endangered it will unite with some other band.

161 According to the missionaries who live in the area, the number of individuals in each band of the Eastern Nambicuara are as follows: Wakitiau, 18; Kitahlu, 45, Hitatau, 17; Chiwtiau, 50. Old census figures give the population of the Western Nambicuara as 500, but the missionaries assured me that they doubted whether even half as many exist today. It must be remembered [164] that an epidemic of measles or "grippe" can diminish the population very rapidly. Syphilis and tuberculosis also exist among them. Judging from the physical appearance of the individuals and their general attitude toward life, it appears that the Eastern Nambicuara, at least, are dying out rapidly.

114 According to Roquette-Pinto, perhaps the earliest visitor to the territory now occupied by the Nambicuara was Antonio Pires do Campo, who went north up the Sepotuba River, which he called Hisipotuba, between 1718 and 1723, and in all likelihood reached the headwaters of the Sacre and Papagaio Rivers. In his Breve Noticia published in 1746, he mentions the Cayre Indians living in the valleys of the rivers running northward into the Amazon River.

Some years later Padre Ayres do Casal mentions a tribe living on the Juruena River, a territory long occupied by the Nambicuara. From 1800 on, rumors about the Indians living in this area increased. In 1862, Dr. Amedée Moure published a monograph on the Indians of Mato Grosso in which he devoted a chapter to the 10 savage, man-eating tribes, among whom he listed the Umotina, Cabixi, Nambicuara, and the Tapanuma (Roquette-Pinto, 1938, pp. 26-51).

The first reliable accounts of the Nambicuara date from 1907 to 1912, the period when General Rondon was putting up the telegraph line between Cuiabá and Porto Velho. In 1912, Roquette-Pinto visited the Nambicuara and the Parecí, and later published the results of his investigations in his book entitled "Rondonia." This book undoubtedly is the first anthropologically competent report about the Nambicuara. After 1910, 648 small Government Indian Posts were established, one at Tolosa on the upper Cravari River, a short distance east of Utiarity, and another called Pyrineus de Souza between Campos Novos and

[p. 84(8)]

headwater streams. The deep clear streams make fishing with timbó difficult. Game in the forests and on the plain is scarce. Yet by exploiting all the resources of the area the Nambicuara are able to survive. In contrast to the other tribes reported in this monograph the Nambicuara have the broadest resource base, as the list of their resources in Appendix 1 indicates.

The Eastern Nambicuara occupy the high plateau between Utiarity and Vilhena. At Utiarity the altitude is 442 meters and at Vilhena 665 meters. The dry season extends from May to September. Except for occasional south winds, which bring a cold drizzling rain for a day or two, the season is clear, cool, and dry, the daily temperatures ranging from 60° to 80° F. During this period the grass withers, the livestock of the white man having to subsist on shrubs and what fodder the owners can provide. Horses and mules, particularly, suffer during these months. In August the Indians burn the dry grass so that with the first showers new grass can grow out and attract the deer, which the Indians can then hunt.

The dry season, which the Nambicuara call *kwakáiwa*, is the most difficult. By the end of June they have consumed the manioc, maize, beans, and other crops which they have planted. During July and August they subsist on palm nuts, cumbarú beans, fruta de lobo, snakes, insects, fish, and whatever animals they can kill on the plateau or in the forest. The rainy season (*wakáiwa*) is divided into periods depending upon the fruits as they come into season. September is known as *yakáiwáiwa*, for during this period the people depend upon the jaboticaba fruit. October and November are called *ya'wandjáiwa*, for during these months the bacaba palm nut ripens. December and January are termed *ólwa*, or piqui time. February and March are known as *oaiwa*, which appears to cover a variety of berries and small fruits. April and May are termed *dzapandáiwa*, as many fruits and nuts come into season, particularly, the cashew nut. During these months the garden crops also come in, giving the Nambicuara a short period of abundance.

SETTLEMENTS AND SHELTERS

Each of the four Eastern Nambicuara bands has a defined area within which it hunts, fishes, collects, and grows its crops. These territories in-

361 621 circle at least one stretch of river and the "galeria" forest which lines its banks. Except during the planting and harvesting season the members of the band are on the move up and down the narrow confines of the territory. Within this hunting territory they have camping places rather than villages. A semipermanent camp site where fields are cultivated for 2 or 3 years is known as *sinaidzu*. Any place where the band or a family may stop overnight is known as *sidzeu*. At present the Wakitiu band has one house (*sive*) at the place 342 621 where it is farming. The entire band occupies the house, each family having its own fire around [513] which it sleeps at night. The unmarried men gather around another fire. Julio informed me that their house is rectangular with stake walls and a gable roof covered with sapé thatch. Some years ago when the band was larger he said they occupied a different place on which they built three houses. These houses were built by placing a series of saplings into the ground to form an oval. The tops were then fastened to a ridge pole, the framework being covered with sapé or palm fronds. A smaller beehive-shaped house is made in the same way. [343 346] Houses of this type are from 6 to 10 feet high. Near the living house they build a small flute hut (*sinadéuktsiwa*) and, when the occasion demands, a shaman's hut (*sikéwtsu*).

342 If the weather is cold while they are out hunting the band or the family may build a temporary brush hut for the night. Sometimes only a windbreak (*sintsutsi*) is considered sufficient. On warm nights during the dry season the group camps under a tree. In favorite hunting places [241] the same camp site will be used repeatedly. When the soil around the permanent camp site or village becomes exhausted, fields are cleared some distance away and small huts are put up for the workers. As the distance increases the old camp site is eventually abandoned and a new camp site is established.

352 As the Nambicuara do not use hammocks, beds, or seats, there is not much in the way of furniture in their shelters. Utensils are restricted 415 to a few gourd vessels, tin cans, burden baskets and small flat baskets, fire fans, bows and arrows, [482 462] and tools used by men. When they move, these articles are placed in burden baskets which are carried by the women. The Wakitiu do not

The Wakitisu do not
323 make pottery, but they sometimes acquire pots from the Paresi in exchange for game or fish.

HUNTING, FISHING, AND COLLECTING

●621 Today, at least, the Wakitisu band is a producing and consuming unit. Whatever a man or his family gathers is shared among the band. This, however, does not mean that the whole band goes out every day or that they keep together while out hunting, fishing, and collecting. Except
594 when the men go hunting such large game as the jaguar, tapir, and peccary, the acquisitive unit is the family. Every morning while Julio's band was camped in Utiarity a family or two could be seen going out, the husband walking in front armed with bow and arrows, the wife following
[482 and carrying a burden basket on her back and a
859 baby strapped on her hip, an older child following her. As they move slowly along they collect
222 fruits, nuts, insects, snakes, ants, lizards, rats, wild honey, and a great variety of grubs or larvae.
226 When they come to a pond they wade around with small baskets in their hands and scoop out small fish. On one of these trips I observed them catching fish that were only 2 inches in length.
[252 These were later thrown on hot coals and eaten
262 without being cleaned. Small birds no larger
223 than a sparrow are shot if the man can get near
222 enough to use his bow and arrow. If they come
[314] to a buriti stalk of the right size they will cut it down, put it into the burden basket, and take it
313 to camp. On their way home they will usually pick up dry firewood. Thus, when a family returns at nightfall the basket will be full of a wide assortment of foods and useful materials.

224 Monkeys, deer, and large birds are generally
[177] stalked by a single hunter, particularly if he has a gun. Julio and Marciano each owned a shotgun and quite often hunted alone. If a man goes out in the morning and runs onto a group of peccaries he will hurry back to camp, and all the men will then go to where the peccaries are feeding. When they hear the peccaries the hunters will form into three files, one heading directly toward the pigs, the other two flanking the game on each side. When near enough the middle file stops and spreads out, the other two files then slowly surround the pigs. As the flanking movement is going on the pigs sometimes move, but the middle group of hunters maintains contact

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

291 Around the waist both men and women wear a buriti cord; if possible, this string is strung with glass store beads. In addition, men sometimes suspend a length of buriti fiber from the front of the belt.

302 Men paint their faces with urucú, drawing a band from each side of the forehead down to the chin, another band across the eyes and bridge of the nose, and then a band from under each eye across the cheeks. On the body they draw two stripes, starting from the abdomen up to the nipples and then over to each shoulder. The arms and legs are dotted with red or black spots. The hair is seldom smeared with urucú.

SOCIAL ORGANIZATION

(See chart 18) $\frac{1}{A}$

619 The names of the Eastern Nambicuara bands appear to be derived from characteristics peculiar
●621 to the band territory. The Wakîtisu are cayman people for there are many caymans (*wakîtsu*) in their territory. The Elôtesu are open plains people, for they live on the open plain (*tatu*) of the upper Camararé River. The Kitânhlu get their name from a small fruit called *tanhtu*. The Chiwtisu are bee people from the word *wasiu*, bee. The Hâgnâisu are buriti fruit (*hâtsu*) people. Although these bands are not politically united under a single chief, and sometimes even resort to open conflict, they consider themselves a single people, or as Julio phrased it, "We can speak with one another and we came from the same hole in the stone mountain."

619 The origin myth of the Eastern Nambicuara, as
773 it is told among the Wakîtisu band, can be summarized as follows:

Before the Nambicuara came there were only animals, birds, plants, and beings who could change from animal and bird to human form. At that time the Nambicuara were inside a stone mountain called *pakatahurukatsu*, which is situated north of the telegraph line near Campos Novos (roughly in the center of the territory now occupied by the Eastern Nambicuara). One day the monkeys heard people speaking inside the mountain and went to tell *ekikkidilisu* who changed himself into a black and white woodpecker and flew with all his strength against the mountain. When the mountain broke some were killed and some injured but many came out alive. The ghosts of the dead people remained around the mountain where they still are and where all Nambicuara go after they die. The injured people *ekikkidilisu* sent into the bush, but the people who were sound of body he put into good clean places and gave them the pierce bow and taught them how

$\frac{2}{n}$ [Cat. 116, p. 123.–Nambicuara] [p. 96 (A)]

648 dependent upon the whites for metal tools, guns and ammunition, and feel it necessary to visit white settlements. The Nambicuara are not above visiting white men for treatment of injuries and cases of severe illness.

619 The interband relationships of the Eastern Nambicuara, although characterised by tensions and periodic open conflicts, are based on a recognition of common origin, common speech, and a degree of intercourse through trade, marriage, and the performance of dances in common. The relations with the so-called wild tribes to the north, on the other hand, are based on war, not just on raiding for loot and women, but on a war of extermination. Although the bands south of the telegraph line no longer participate in war, the bands north of the line still fight on occasion with their enemies which they call the Saltámsu and which the whites call the Beiço de Pau.

721

726 When preparing for a war the chief of the band takes the men into the woods and tells them that there are bad people to the north which they must kill. Then after singing a war song they set about making many arrows and war clubs. The night before the attack they camp near the village of the enemy. The men paint their bodies with the sap of some latex tree and their faces with urucú and charcoal. They then take leaves and stuff them into any holes in the ground or in trees around their camp. After all the holes are stopped up, they take the skin of an anteater, the skin of a toad, and the leaves of a tree, which are used in preventing rain, and burn them. The stopping of the holes is believed to prevent the enemy from hearing them, the smoke is to blind the enemy's enemies and, also, to make the enemy sleep soundly. The chief remains at this spot and sings all night with the shamans. At dawn the young men approach the huts of the enemy, stand in the doorways and shout, and when the occupants awaken they are shot down or clubbed. No one is spared. They then take whatever they can, burn the houses, and return to the chief and his singing shamans where the loot is distributed among the warriors.

621 The internal organization of the band is based upon kinship and is perpetuated through cross-cousin marriage. One belongs to the band of his or her mother. Julio explained that when the daughter of the wife whom he abducted from the Eléteu reaches puberty she will return to the

[p. 98(R)]

621 Elótasu band. This is the custom among all the Eastern Nambicuara bands.

601 The kinship terminology belongs to the bifurcate merging type. The term *tayáiaru* (grandfather) and the term *gnatakóiaru* (grandmother) are extended to the brothers and sisters of one's grandparents. The term *awiniru* (father) and the term *akakíniru* (mother) are extended to father's brother and mother's sister, respectively. Father's sister is termed *akainuru* and mother's brother *arainuru*. A man calls his older brother *akanánuru*, his younger brother *dandidniru*, and his sisters *awidinuru*, these terms being extended to parallel cousins. The terms for son (*akirúru*) and daughter (*akenúru*) are extended to the children of a man whom ego calls brother. The terms for sister's son and daughter are *arudíu* and *aninu*, respectively, these terms being extended to the children of anyone whom ego calls sister. The term for male cross cousin is *arákiru* and that for female cross cousin, *dandu*. There is just one term for grandchildren, *pantandiuruwa*.

The only affinal kinship terms which we could obtain were the terms wife (*anáu*) which bears a close relationship to female cross cousin; husband (*amandiu*); and the terms for father-in-law (*arainuru*), and mother-in-law (*akainuru*), which are identical to the terms for mother's brother and father's sister. Whether women employ different kinship terms was not ascertained owing to the fact that the women refused to discuss the matter and the male informants persisted in going to sleep when the subject was broached.

582 The kinship terminology supports the statement made by the Nambicuara that cross-cousin marriage is preferred. Excepting one Elótasu woman all the wives in Julio's band were Wakíltisu and cross cousins of their husbands. At the death of
587 the husband the wife and children pass to the
768 deceased husband's brother. Women sometimes marry their mother's brothers. Residence is patri-
591 local although when marrying a woman from another band, the man sometimes remains with his wife's band for a while. Band membership, as has been stated, is determined by matrilineal descent.

622 The powers of the chief are limited to leadership in such activities as hunting, planting, trade, and ceremonies. Raids, although organized by the chief, are not led by him. The chief admon-

534 *kadáwa*, the nose flute, *naittáwa*, and the five-tube panpipe, *dútu*. The nose flute which is about 4 inches in diameter is made by sticking two round pieces of gourd together with rosin. Three holes are made on one side, two holes providing finger stops, while air from one nostril is blown across the other. These flutes do not appear to have any ritual significance.

771 In reviewing the religious symbolism of the Nambicuara it appears that the following conclusions can be drawn. The *ohhádidiu* myth explains the origin of the Eastern Nambicuara and their rights to the territory which they now occupy. *Tsuptá*, although not the cause of illness, explains why people die. *Tsuptá* and *dihnáwa* also account for the existence of shooting stars and the presence of rain. *Ulurá* appears to represent the ever-present forces of destruction inherent in the physical environment. Within the framework of these ultimate forces the Nambicuara carry on their struggle for existence assisted by and opposed by the members of their own kind. The security of the band depends upon the close cooperation of the kinsmen acting under the guidance of the chief. The *wáiarku* flutes provide a supernatural sanction for the powers of the chief and thus help in enforcing and maintaining band solidarity. The flutes, furthermore, are a symbol of the common ancestry of the Eastern Nambicuara in that they relate the bands to the culture hero. The ghosts of the ancestors (*sydokadiu*), like the living members of the band, must be well-treated in order to avoid danger to children and the perpetuation of the band.

619 But actual day-to-day danger to the individual comes from the members of other bands. Disputes over women and quarrels arising from the exchange of goods, as we have seen, lead to bloodshed and death. In the ultimate analysis each ●[621] band defends itself as a sovereign unit by force. The danger arising from the constant tension and suspicion between the bands is symbolized by the *enánau* who bring illness, who create the storms which destroy the houses and fields, and who threaten the band with starvation by making hunting difficult. As direct attack by other bands is met with the physical forces of the band, so spiritual attack by the *enánau* of other bands is met by the assistance of one's own *enánau*. They help the shamans to draw out the evil objects

SP17 Nambicuara SP17

sometimes the fathers of several children, walking together at dusk and tenderly embracing each other; always

tordię ialdsiętę

(these are) brothers-in-law embracing (each other).

Certain games, too, such as the "scratch game" (in which the opponents try to scratch each other especially in the face), are commonly played by brothers-in-law.

But the close relationship between "cross cousins actually or potentially allied through a sister's marriage"—the more accurate translation of the aboriginal term for brother-in-law—may extend far beyond the family tie. Actually, it is sometimes used to establish between individuals not belonging to the same kin group new links of a special nature, the function of which is to amalgamate into a single familial unit several formerly unrelated groups. This is brought out clearly in the following case.

During the past twenty years, several epidemics nearly destroyed the central, northern and western divisions of the Nambikuara. Several groups were decimated to such an extent that they could no longer successfully maintain a socially autonomous existence. In the hope of reconstituting functioning units, some of these, therefore, attempted to join forces. In the course of our field-work we met and worked with such a merged group made up of seventeen individuals using the northern dialect (*Sabãnę* group) and thirty-four using the central dialect (*Tarãnãę* group). Each of the originally distinct groups, however, lived under the guidance of its own chief, although both leaders closely cooperated. It is probable that the demographic crisis did not by itself account for this situation, since the people of the second group formed merely a fraction of a more numerous unit from which it had split off for reasons unknown to us. However, from several events which occurred during our stay with them, we deduced that the break had been caused by political dissention, the details of which remained obscure to us. In any event, these groups now travelled and lived together although two separate but contiguous camps were maintained in which the families formed distinct circles, each around its own fire. The most amazing feature of this curious organization was that the two groups did not speak the same language and were able to understand one another only through interpreters; fortunately, one or two individuals belonging to each group had sufficient knowledge of the other dialect to act as intermediaries. Even the two chiefs could not communicate directly. The problem of whether these dialects belong to the same linguistic stock need not be raised here; but the Northern group undoubtedly must be classified with the Nambikuara cultural family because of the similarities of material culture and of the life pattern, and chiefly because of the psychological attitude of the people, who very evidently believed in their close affinity to the Central group.

342 In order to erect one of these screens, which the muleteers call "little hunting huts" [maloquinhas de caça], and which are found scattered between the Juruena and Doze de Outubro rivers, the Indians begin by clearing the ground thoroughly. Then they plant two large leafy branches into the earth, one at each end of a straight line, and bend them at the top over a crosspiece held by two forked stakes sunk into the ground in front.

They complete the covering with straw or with grass rooted up for the occasion, the earth still clinging to its roots.

Inside--or rather beneath--the shelter, a small fire is lit.

Each screen covers an area of approximately two to four square meters. If the Indians are numerous, each family group erects its own shelter. The structure is actually a good representative of what German ethnologists call Windschrim [windscreen].

The Indians of the groups farther north (Tagnani, Tawite) do not build their temporary shelters in the same way.

As a general rule, their provisional dwelling is simpler: it consists of one or more leaves of the babassu or some other palm [225] which are stuck into the ground. This is not a windscreen, but a mere shade against sun or rain squalls.

361 These [latter] Indians, incidentally, live in a region of extensive forests and thick bush which affords adequate protection against the rain; whereas the others inhabit an area consisting largely of fields and scrubland. Another instance of the geographic environment conditioning human behavior.

[421] The Cocozu Nambicuara call their village sicũ, while the Anunze call it chicẽ. These words have the general meaning of "dwelling place": they signify either "house" or "village."

We do not know with certainty how they build their permanent dwellings.

[343] The women alone take part in the building of a hunting shelter; they cut down the necessary branches, while the children help by gathering the grass and straw which serve to complete the roof.

They change their dwelling place frequently. While following the trail that brought us to the Juina River village where we spent the night, we passed several former sites of the village.

[36] Eastern group, dialect a1: oaklétosu (a1); yalíere (b1); yaliririte (c).

621 [161] This group, comprising 23 persons divided into six families, was found in the region of the Papagaio River (Utiarity) upon the occasion of one of its excursions in the nomad period. As we learned later, it was part of quite an important Indian community localized in several villages or camp sites in an unexplored zone of the right bank of the Juruena River, where we went, traveled and lived with them. The dry season and the period of nomadism does not seem to have been the only reason for the isolation of the group; some differences re- [22] lating to command had seemingly provoked a break, grouping a certain number of individuals around an active and ambitious chief. We have, undoubtedly, been called on to play a semi-conscious role in this fight. We shall return to this point when we treat of command. However, the encounters of the group with other bands belonging to the same community have always been cordial. The meeting with a first band approximately restored the population of the winter vil- [161] lage; and the strength of a neighboring village, found later on, increased the number to 75 persons, the largest number of Indians that we saw united in eight months.

As will be seen by the geneological chart opposite, the restricted group is composed of four generations, the oldest reduced to two individuals, the following being composed of "husbands" and "wives," "brothers," "sisters," "brothers-in-law" and "sisters-in-law." The third and the fourth, finally, constitute a complex mixture of children, sometimes at an early age, considered as "children" or "relatives," and of adults classed as "brothers," "sisters," "husbands," and "wives," and shifted to a generation younger than their normal one because of their situation as children of older brothers.

Before giving several quick pieces of information about each of the members of the group from the point of view of his situation in the kinship system and of his individual psychology, it is necessary to stop for a moment at the question of proper names.

• • • •

551 Proper names are never pronounced among the Nambikwara. A very strict prohibition forbids them and raises a nearly insoluble problem for the notation of genealogies, even though the taboo does not seem to be as rigorous for the dead as for the living. Nevertheless, one [37] never hears a proper name, and individuals call one another

601
621

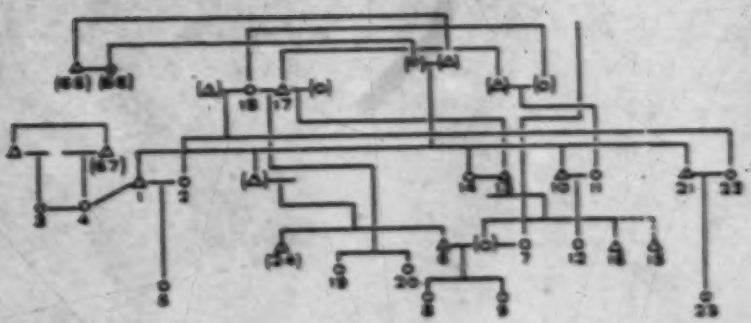

Fig. 11.
Genealogical composition of group a1.

622
115
157 A1. --The chief of the group. He is a man of about 35 years, married to three women: a2, by whom he has a daughter a5, and a3 and a4, both daughters of "sister," without child.

A1 is remarkably intelligent, conscious of his responsibilities, active, enterprising and ingenious. When we went to visit his village, he did not hesitate to follow a new itinerary, unknown to him, because our horses could not pass along the habitual path. And when we arrived at the village, we found the stakes necessary to tie our oxen and horses, which he had had set up by a party sent a few hours ahead of time.

His attitude concerning writing is very revealing. He immediately understood his role of signing (1), and the social superiority which it

531
212

1. The Nambikwara of group a are completely ignorant of drawing, if one excepts a few geometric tracings on gourds. For several days they did not know what to do with the paper and pencils which we distributed to them. A little later, we saw them deeply engrossed in tracing wavy lines. In doing this they were imitating the only use which they had seen us make of our note pads, that is, for writing, but without understanding the purpose and significance.

531
212

Besides, they called the act of writing: iekarinkedinru (a1), that is "make lines," which for them had an esthetic interest:

(3) Kihikagnere mu'iene (b1).
It is nice to make lines.

[77]

The drawings reproduced in Figure 19 thus constitute a cultural innovation inspired by our own drawings.

622 confers; also [41] he asked us for a note pad and a pencil, and we
115 are likewise equipped when we travel together. He does not com-
157 municate to me verbally the information that I ask of him, but traces on his paper some wavy lines and presents them to me as though I should read his response. But he himself is half duped by his comedy. Each time that his hand finishes a line, he examines it anxiously, as if the significance should miraculously spring forth, and each time, the same chagrined disillusion is painted on his face. But he doesn't give in. And it is silently understood between us that his scrawl possesses a meaning which I pretend to understand. Naturally, the verbal commentary follows almost immediately, and excuses me from having to demand some very necessary clarifications. When we discuss command, we shall return to certain aspects of this semi-mystification.

He is a valuable informant who understands the problems, perceives the difficulties, and is interested in the work; but his functions absorb him often, and he disappears for whole days on a hunting expedition, a survey of itinerary or a localization of ripe seed or fruit trees. On the other hand, his wives often call him to tender love games in which he lets himself be voluntarily involved.

In a general way, his attitude shows a logic, a continuity of purpose, very exceptional among the Nambikwara who are often unstable and temperamental. Placed in other conditions and with other means at his disposal, he might be a valuable organizer. And he is, after all, alone responsible for the destinies of his group, which he conducts with competence, although in a sometimes utopian spirit.

The father and the mother of A1 are dead. But his father's brother and mother's sister, whom he calls ahy'hosu and ay'hitsou live in the same village (A65 and a66).

115 a2. --About 30 to 35 years. The eldest of the wives of A1, mother of a5, daughter of a18 and a now dead father. She is serious industrious, a little reserved in social relations. In the triple household

621 comment later (1) on the complex motives that might have induced

1. Cf. p. 77.

[497] these two bands, speaking different dialects and who were not even capable of understanding one another without an interpreter, to practically merge. It seems that group b1 was composed of the rare survivors of a formerly important formation now disappeared, living previously in two distinct groups, around the sources of the eastern tributaries of the Roosevelt River. We have already tried to calculate these losses, resulting from recent epidemics (2). Group c had,

2. Cf. above, p. 6.

[578] without doubt, gone through the same hardships. Moreover, its position had been compromised by antagonisms with other bands rising from the same dialect, and who had formerly been their allies. A visit, with a commercial goal, of related Indians originally from the south (members of the group known by the name of Kabixi) must have raised the forces of group b1 to 21 persons for 621 several days. Here is its composition at this moment:

115 157 622 601 Fire 1 (1 to 7). --The family of the chief of the band. The chief, B1, is 30 to 35 years old, and one of the most intelligent Indians whom it was our privilege to encounter. But he is intelligent in a way very different from A1. The latter is prudent and very resourceful, always meditating some political combination. On the contrary, B1 is not a man of action, but rather contemplative, with a charming and poetic spirit, and rich sensibilities. He is fully conscious of the inevitable decadence of his people, and this conviction often shades his words with a subtle tint of melancholy:

(4) ĺoⁿndiuⁿẽ ; oⁿhaĺne hẽñi niho ⁿmẽdeuⁿẽn. (b1)

"I also did the same thing, now it is finished," [51] he says, remembering happier days when his group, far from being reduced to a handful of individuals incapable of keeping alive their traditional customs, was comprised of several hundreds of participants faithful to all the manifestations of the Nambikwara culture. His curiosity toward our customs and towards those which we had been able to observe in other tribes is just as great as ours. With him, ethnographic work is never unilateral. He conceives of it only as an exchange of information, and what we bring him is always very welcome. Often [77] he even asks us for--and preserves carefully--drawings representing

621 feather ornaments, hair styles, arms, such as we have seen among
115 neighboring or faraway peoples. Did he entertain the hope of per-
157 fecting the material and intellectual equipment of his group thanks
● 622 to this information? It is possible, even though his dreamy tempera-
177 ment hardly ever drives him to realizations. However, one day when
601 we were interrogating him concerning the Pan pipes, to verify the
area of diffusion of that instrument, he answered that he had never
537 seen any, but that he would like to have a drawing (different from
539 group a, group b does not have real pipes of Pan, but instruments
made of two or three tubes of equal length and giving approximately
the same note, tied together with cotton thread and wax). With the
aid of our sketch he succeeded in making a crude but usable instru-
ment.

621 B1 had two wives: b2, about 25 years, mother of two little
601 girls of 5 to 7 years, b4 and b5; and b3, older than he (about 40
years old), mother of a boy of 7 years, B6, and of a girl of 9 years,
b7.

Fire 2 (8 and 9). --A son of a deceased brother of B1, whom the
latter then calls "son" (about 25 years old), and his wife about 18,
sister of B13; no information about the father and mother.

Fire 3 (10 to 12). --B10 is a brother of B8, and B1 calls him "son"
also. His wife, b11, of undetermined parentage, is about 20 years
old, and his daughter b12 about 6.

Fire 4 (13 and 14). --This household presents the only sure case of
oblique marriage in group b1. B13, about 25 years, married a girl
of 16 or 17, b14, daughter of a dead son of the dead brother of B1;
he calls her then, as seen before, tasuite.

Fire 5 (15 to 17). --These three individuals are the last survivors
of a related group destroyed by an epidemic. After the disaster,
they joined the band of B1. B15, about 35 years, is the brother of
b2, thus tarute of B1. His wife, the same age, b16, is a sister of B1,
thus ndedere of b2. Their son, B17, is about 5. The daughters of
B1 call him (B17) "husband," and he calls them "wives."

621 [52] The visitors. --They came from the region lying between
579 the sources of the tributaries of the left bank of the Juruena and of
601 those of the right bank of the Guaporé. All were related to their
hosts, and were distributed among three generations. The oldest was
comprised of three individuals: B18, about 50 years old, father of
B21, B25, B27, and B29; his wife b19, the same age, paternal aunt
of B1; and the brother of the wife, B20, 40 years. Besides the
children of B18 already mentioned (from 20 to 30 years old), the next

1: Lévi-Strauss--100 E-5 (1938-1939)1948 SP17 Nambicuara SP17

122 Each band recognizes the leadership of a chief (ẽlhetu, a1/2; ẽlikãde, b1/2; ẽlikãpara, c). He commands the group, or more exactly the group of adult men who are his "companions" (nukẽnẽlore, b1/2). These see to it that the orders are carried out by their wives, who are rarely consulted. The women conform to the decisions of the men, but they do not, in the collective plane, execute them directly. They take part in this only inside their family group, within the limits of sexual division of labor such as we have previously described it. The tasks of the chief are diverse. The principal and most permanent consist of the administration of the group. It is the chief who decides the seasonal occupations at the beginning of the nomadic period,

27. ẽlikãkwanaiene ẽjnaaenaẽ (b1)
the chief commands: everybody on their way!

the moment and place where they will camp for the rains, the gardening work and choice of plantations, the construction of huts, the itineraries of trips and times of stopping, hunting expeditions, gathering or collecting trips, the conduct to be observed as regards neighboring groups. His role is generally summed up by the formula:

28. ẽlikã nãẽna ẽenate (b1)
the chief walks ahead. (1)

1. Thus, the philosophy of power does not seem to have been modified among the Brazilian Indians since the far-away day when, upon the occasion of an encounter made at Rouen, Montaigne made this statement: "Concerning what I asked him as to the fruits which he received from the superiority which he enjoyed among his people (for he was a Capitan and we sailors named him King), he told me that it was to be the first to march to war..." (Essais, éd. de la Pléiade, Paris, 1939, Ch. 31 "Des Cannibales").

123 He also goes away much more frequently than his companions, for one or more days, accompanied by one or two of his polygamous wives who assist him in his enterprises, (2) with the purpose of

2. See above, p. 60 f.

discovering grains or fruits, [87] groves of piquy (a type of fir), of caju (Anacardium sylvestre), the heads of streams frequented by small game, where to lead his group, always searching for means of subsistence. His role is also that of maintaining internal discipline and of opposing the bad intentions of recalcitrants:

29. odnanjenuatonje hutonto igalagatiene (b1)
Lazy one, I order you, that is enough, to work!

The only sanction at his disposition is that of obtaining the agreement of his companions to expell one who has become guilty of a fault (1) or who shows himself to be rebellious to collective life.

1. Cf. below, p. 111.

But that is only possible in the case where a single member of the group shows lack of discipline. The chief should show a continual talent which is more closely related to electoral politics than to the exercise of power, to maintain his group, and if possible, to enlarge it by new adherents. The nomadic band in fact represents a fragile unit. If the authority of the chief becomes too demanding, if he monopolizes too great a number of women, if he is not capable in periods of need of resolving the food problems, discontent is created, individuals or families break away, and go to attach themselves to a related band whose affairs seem to be better conducted--better nourished thanks to the discovery of a hunting or collecting site, or richer because of barter with neighboring groups, or more powerful after victorious wars. The chief then finds himself at the head of a too restricted group, incapable of facing daily difficulties, or whose women are exposed to being carried off by stronger neighbors, and he is obliged to renounce his command in order to join a more happy faction with his faithful followers; the Nambikwara society is thus in a state of perpetual flux. Groups form, are broken up, grow and disappear and, in several months' time sometimes the composition, number and division of bands become unrecognizable. All of these transformations are accompanied by intrigues and conflicts, by rises and falls, the whole being produced at an extremely rapid rhythm.

In exchange for the authority which they recognize in him, his companions are very demanding in regard to their chief; and if a decision made by him places the group in some difficulty, he is left alone to find means of surmounting it. We remember a trip undertaken by mutual consent, rendered more difficult than had been thought by the necessity of discovering a new itinerary along which our mules

and oxen for carrying could pass. The provisions of manioc proved to be insufficient and one morning the little band found itself without anything to eat. Our own attempts to kill some animal were in vain, and the worst [88] bad humor began to reign, the chief of the group being obviously held responsible for an affair which we, he and I, had contrived. In place of undertaking a hunting or collecting expedition, each one decided to go to sleep in the shade of shelters, and they left the chief alone to find the solution to the problem. He disappeared, accompanied by one of his wives (his first wife a2, contrary to usual procedure; but a3 and a4 shared the general irritation) and toward evening both were seen reappearing, their heavy baskets filled with grasshoppers which they had spent the entire day catching. Although grasshopper pie is not a particularly esteemed dish, everyone ate with good appetite and found his good humor again. They took up the journey again the next morning.

But other things than these exceptional relief measures are expected of the chief. He must sing and dance willingly and well, and be capable of animating the collective life. He must organize the work in the most reasonable way in order to eliminate useless fatigue and effort. Thus on the eve of a departure, B1 recites for us his order of march:

30. mãdõtrige mãdohõdhudne hajtehãdige nãnjehnile
gietmonõnahara jãnehara kanahanĩ'ndeere hinkõnaha
iinãmnje ãkeema iinamnje ihikoro ihikoro. (b1)
When it is hot, one is tired, one is hungry, the
children walk badly; when one marches at dawn,
one marches well, at dawn, one should march, change
routes, march; on the way! on the way!

He must also win over his companions by numerous gifts. According to B1, who gives in willingly to the servitude of power, generosity plays a fundamental role in determining the degree of popularity which the new chief will enjoy, and the companions indulge in all sorts of speculations:

31. gilikã abẽni ãnire tunun?ãtutnagilikã agnãhare
nnãtjani (b-1)
The chief is leaving; the one who will come will give me
a great deal.--"Chief! Be generous! Give to me!"

The presents thus anticipated consist of food or objects which the chief will have made himself with the assistance of his polygamous wives, or that he will have procured by good exchanges with neighboring bands, or which might come from war booty. Often, it seems,

622 he is incapable of satisfying increasing demands, and must refuse firmly:

32. Mĩnde hõta agnãre Hõta (bl)
The giving is finished! Being generous is finished!

[89] or must even pose the question of confidence:

33. dahĩ'ri (gi) dajẽ tununadjẽ tundnẽnetine hãnerejane (bl)
Go away! Giving is done with! Let another be generous (in my place)!

622 However it evidently depends on his ability and moderation whether
648 or not these refusals keep the demands of his companions within reasonable limits or provoke discontent and resulting ruptures. Under these conditions, the relationships which the chief succeeds in cementing with the outside world--other Nambikwara bands and neighboring tribes--have extreme importance. The chief has traveled widely. Within the limits of his territory, he has visited tribes different from his own and which his companions know only through his commentaries. We ourselves have had the impression of being used for political purposes: we have told above what the reactions of Al were as regards writing. (1) He wished on this basis to attempt a vast operation, and

1. See above, p. 40 f.

he united several related bands under the pretext of meeting us, begging us without explanation to postpone the exchange of objects with the Indians. This enigmatic attitude lasted till the day when, assembling all his guests in a circle, he exhibited a piece of paper covered with wavy lines, and made a pretense of reading to each individual the nature and importance of the present which I was supposed to give to each one. All this with my complicity, obviously stupefied and immediately acquired. The Indians were even more impressed. The plan, such as we were able to understand it, consisted of fortifying his power by presenting himself as the sponsor and protector of the white visitor, whose secrets he was reputed to know at the same time. But the card of civilization thus played is assuredly vain. Six months later, we found Al at the head of a severely reduced group and without illusion as to the failure of his vast projects. He watched us leave with real sadness, as though he were losing, with us, the last vestige of his prestige.

622 The charges of leadership being presented under such unattractive colors, one might ask what makes an individual accept them. It was not possible for us to determine exactly what the modalities are to be

(22 named chief. One single point is clear: his functions are not hereditary. When the acting chief falls ill or becomes too old to carry on his charge, he points out from among the members of the group the one who will be his successor, doubtless influenced in his choice by collective opinion. He makes the decision public by the formula: hẽ̃ gilikãde (b1): "this one will be chief," and thus the continuity of power is assured:

34. gilikaa dɛterige tʃahʔliki'herage niaare gilikãde (b1)
When the chief dies, another chief comes in his place.

[90] But it happens that the person in question caring little for the heavy responsibilities which await him, declines the honor which has just been done him:

35. tʃnjane tʃngilikã ʔilikãdnere (b1)
I do not wish to take the place of the chief.

and it is necessary to proceed to a new choice. What are then the motives which might determine the acceptance? Sexual preoccupations certainly play a role. If the newly elected is young, in place of going through a long period of celibacy or of being forced to marry an old woman, he will find himself in the privileged position of having several companions. If he is already married, he can add to his wife the youngest and prettiest among the available women of the group, or among those who will be conquered in war, and eventually obtain those whom he would desire and who would be already married.

C20, having lost his wives through illness or for some other reason, found himself a bachelor. He then took his young wife (c21) [90] from another husband, under the pretext that the latter was "too young to have a wife." Undoubtedly his liking of responsibility must equally be taken into consideration, his sense of leadership, ambition, and his desire for a fuller existence than that of normal life. The only two chiefs with whom we had any real personal contacts (A1 and B1) were both individuals of particularly lively spirit and, in giving to the term the sense which it might possess in these societies, more cultivated than their companions. (1)

1. The Indian theory of command has been the object of a more detailed study: C. Lévi-Strauss, Chief and chieftainship among a primitive tribe: The Nambikwara of Northwestern Mato Grosso. Transactions of the New York Academy of Sciences, 1944.

1: Lévi-Strauss--105 E-6 (1938-1949)1948 SP17 Nambicuara SP17

622 The command carries, moreover, a certain number of fixed offices. It is the chief who makes the poison for arrows; and he presides over ceremonies of initiation, of marriage or burial, concerning which we shall speak later. He organizes chants and dances, festivals both when they assume a ritual character, and when they have as a goal purely secular distraction. It is he who organizes 622 ball games. The ball game is widespread in western and northern 526 Mato Grosso, for it is found from the Paressi to the tribes of the Lower Guaporé. Among the latter people we have been able to gather evidences of its sociological significance. It is perhaps the same among the Nambikwara; but, at least during the period of nomadic life, the ball game is practiced with a purely recreational goal in mind. The teams are built up haphazardly from those present and upon the spur of the moment, and the game takes place in a spirit of complete improvisation.

WAR AND TRADE

648 The two subjects should be treated simultaneously, commercial 609 exchanges usually representing potential wars peacefully re-[91] 439 solved, and the wars, the outcome of unhappy transactions. Among the numerous bands which cross through the bush during the dry season, it is necessary to distinguish those who are related by family ties, and who often represent the population of a winter village—or of a group of villages—which has "burst forth" in the pursuit of the nomadic life. Among themselves these bands entertain relationships which are normally pacific, although not necessarily so. On the contrary, bands which are strangers to one another, composed of members not related among themselves and whose geographic location is far distant, or who are even separated by differences of language, mistrust one another at the same time that they feel themselves necessary to one another. Only when they meet can they procure desirable articles which only one of them is capable of obtaining or of making. These articles seemed to us to belong essentially to three categories: first of all women, whom only victorious expeditions are permitted to carry off. Next seeds, notably bean seeds, and finally ceramics, or [285] even fragments of pottery used to make the weights of spindles. Group [94] a1 whose cultural level is clearly inferior (especially in its ignorance concerning pottery) to that of its western and southern neighbors, according to the word of its chief, had carried on several campaigns during the last few years with the goal of procuring these two last articles.

collectively obliged to make reprisals for an injury done one of its members. Much more often, given the very lively and permanent animosity which reigns between the groups, these pretexts good for exciting the spirit are voluntarily entertained, especially if they feel strong either because of the importance of the group's strength or because of an alliance with neighboring bands against a common enemy, concluded by the intermediary of messengers acting as ambassadors. The proposition of war is presented by an exalted individual or one who exposes before his companions his particular griefs, in the same tone and style that speeches were made at the encounter.

39. ẽ̃ akinãẽ̃ ẽ̃dnãẽ̃ gõdegãẽ̃ kakoũẽ̃ ordnẽ̃ galagrĩẽ̃ẽ̃ (b1) whose approximate sense is: "Hello! Come here! Let's go! I am irritated! very irritated! arrows! big arrows!" The Indians become so excited upon the occasion of these epic speeches that it is not possible to obtain the commentary of the formula except well after they have been cited and undoubtedly very unfaithfully. But war is not a matter of purely profane decision. It necessitates a preliminary ceremony which will determine if the signs are favorable or not. Dressed in special attire, tufts of buriti straw dappled with red, hoods of jaguar skin, the men assemble under the leadership of the chief and execute the special dance and chant of war. (1) A divining rite

1. Dances and music will be the object of a special publication.

is then performed. The chief, or the sorcerer in the groups where he exists, goes solemnly to hide an arrow in a corner of the bush. The arrow is retrieved the next day. If it is covered with blood, the expedition is undertaken, if not, it is given up. (2) Many warlike

2. This symbolic use of an arrow seems typical of cultures situated north of the Amazon. The fact is interesting, given the northern affinities of the Nambikwara language. Concerning the use of the arrow as the message of war, cf. Roth, "An inquiry," etc., Annual report of the Bureau of American Ethnology, 30, p. 362; Koch-Grünberg, Zwei Jahre unter den Indianern, etc., Berlin, 1910, Vol. II, p. 316; Gumilla, Historia Natural del Rio Orinoco, Barcelona, 1791, Vol. I, p. 134.

expeditions thus begun end after several kilometers of marching.

he was completely naked, that is, divested of his
756 necklaces, bracelets, earrings, and belt, and by the light of our
[301] electric lamps we could make out his tragic expression and his pale complexion. He let himself be helped to the camp without difficulty, where he sat down without a word and in a completely impressive attitude of dejection. Little by little, his story was drawn from him by an anxious listener. He explained that he had been carried off by the thunder (am?), [a storm had broken the same day]; the thunder had carried him in the air to a point which he designated at a distance of 25 kilometers from the camp (Ananás River), had divested him of all his ornaments, then brought him back the same way and left him in the place where we had discovered him exhausted. Everyone went to sleep commenting on the incident and the next morning, C20 had recovered not only his habitual good humor, but also all his ornaments, which amazed no one and for which he offered no explanation. But the following days a very different version of the event began to be peddled by the Tarindé. They said that, far from having entered into relationship with the other world, C20, under the cover of a magical disappearance, had gone to undertake
[678] some transactions with a band of Sabané Indians who were camping in the vicinity. These insinuations were never developed further, and the official version of the affair continued to be ostensibly admitted. However, in our personal relationships, B1 let his preoccupations be seen upon several occasions. As the two groups left us shortly after, we never found out the outcome of the story.

756 No information has been uncovered concerning the manner of
279 naming the shaman as such. In the preparation of the arrow poison, C20 was assisted by his potential son-in-law C25.

* * * * * *

622 [104] Besides his supernatural attributes, the chief, or shaman,
756 plays another role, that of "leader" in ceremonies and celebrations.
796 The Nambikwara have three types of ceremonies. Those which mark the critical moments of each one's existence, such as birth, initiation, puberty, marriage, death; the seasonal festivals; and finally, the ceremonies celebrated on exceptional occasions: war and hunting or scavenging expeditions. We have already alluded to the rites of war, and we shall speak farther on of the ceremonies of the first type. We shall limit ourselves here then to some brief observations concerning the others.

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

string (secondary release). Four types of arrows are used: (1) featherless fishing arrow with three to five prongs; (2) bird arrow with a blunt point; (3) big-game arrow with a lanceolate bamboo point; and (4) poisoned arrow, used chiefly for hunting monkeys, with several barbs which are attached to the point with cotton wrapping and which break easily in the wound, being, therefore, usually protected by a bamboo sheath. The last three have a bamboo shaft and "Arara" feathering. Sewed feathering is known by the central and northern groups but seldom used. For warfare, big game arrows with serrated bamboo points are used.

Nambicuara arrow poison is a curare prepared by grating the root of a *Strychnos* shrub, and by infusing (*Eastern Nambicuara*) or boiling (*Central* and *Northern Nambicuara*) it until the water evaporates and leaves a thick brownish substance, which is smeared on a wax-coated arrow point. It can be preserved in tiny pots for several months. Among South American arrow poisons, it is remarkable because it is made of only one vegetable substance and is prepared openly—in some groups by the chief or shaman, in other groups by anyone—without magical practices or taboos. Its great toxic properties were studied by Vellard (1939 b).

Other poisons of unknown composition are used for amorous or political revenge. They are in the form of powders and are kept in tubes made of feather quills, bamboo, or other woods, each ornamented with paintings and cotton or bark wrappings.

Clubs are carved in the shape of a flattened or cylindrical pointed spade; the handle is often adorned with black and white plaiting of philodendron bark and bamboo strips. Their purpose is mostly ceremonial.

SOCIAL AND POLITICAL ORGANIZATION

Kinship terms identify parallel-cousins with siblings, and cross-cousins with potential or actual spouses. Cross-uncles and cross-aunts are called by the same terms as parents-in-law and grandparents; parallel-uncles and parallel-aunts are equated with parents. Similarly, parallel-nephews and parallel-nieces are classed with children, and cross-nephews and cross-nieces with children-in-law. Marriage is between cross-cousins or between the maternal uncle and his niece. Monogamy is the rule, but polygyny is the privilege of the chief and other important men. Polygyny is usually with several sisters (sororal) or with a woman and her daughters by a former union. The first wife runs the household, subsequent wives being assistants to the husband. The deficiency of available women which results from polygyny is compensated by homosexuality between adolescent male cross-cousins (Lévi-Strauss, 1943 a).

The village is ruled by a chief, but each of the nomadic bands into which it splits during the dry season is led by a secondary chief. Chief-

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuára SP17

tainship is not hereditary; the chief, when old or sick, designates his successor from the ablest men of the group. The chief's authority is slight; it depends wholly on the good will of the family heads. 622

Relations between neighboring bands are inspired both by fear and by the desire to exchange goods. Warfare, therefore, is closely connected with barter. Groups not acquainted with each other use ritual speech when they meet. 619 438

Before starting a war expedition, a divinatory rite is performed with special songs and dances. An arrow is hidden by the shaman, the outcome of the expedition being presaged by its appearance the following day. 721 787

LIFE CYCLE

Childbirth.—After the delivery of a child, the placenta is buried in the bush and both parents are subjected to rigid prohibitions concerning food, the use of ornaments, and social contacts. 844

Puberty.—The initiation rite for young men consists of piercing their lips and nose and giving them their adult personal name. At her first menstruation, a girl is isolated for several months in a special shelter outside the village, where she is given ritual food by her mother. At the end of the rite, she takes a long bath in the river; this also constitutes the first step of the marriage ceremony. 881 [304]

Both cross-cousin and avuncular marriages (see p. 367), are often planned by parents for their infant children. Marriage is celebrated by festivals, banquets, and dances. The union is pronounced by the chief. Fish and fishing are important both before and during the ceremony. 584 585

Separation is frequent, the chief cause being that the man seeks a younger and prettier woman. There is no social sanction of adultery, except that the seducer is advised by his companion to go away for a while so as to avoid the husband's revenge. A murderer also flees vengeance. 586 684 682

Death.—Some groups of *Nambicuara* bury their dead in a circular pit, the corpse being placed in a crouching position. Others leave the corpse to decompose in an elongated ditch and later wash the bones in the river, put them in a basket, and bury them in the village, which is then abandoned. Weapons, implements, adornments, and other property of the deceased are destroyed, but his garden—if he owned one—is abandoned only for a few months. Later anybody may cultivate it. 764

ESTHETIC AND RECREATIONAL ACTIVITIES

Art.—Most *Nambicuara* groups are completely ignorant of drawing, although some groups decorate calabashes with dots and straight and sinuous lines. These are conventionalized reproductions of realistic designs found among other groups. 531

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

relationship from becoming really operative in the constitution of the band. It can be said that, inside the band as well as between the different bands which are the offspring of the same temporary village, everybody is everybody's kin, in pretty much the same fashion.

Why then the splitting-up process? Two different considerations must be brought forth to answer this question. From an economic point of view, the scarcity of wild food resources and the subsequent high square-mileage needed to feed one individual during the nomadic period make the division into small bands almost compulsory. The real question is not why there is subdivision but rather on what basis it takes place. I have said that this is done by free choice, but this freedom is not arbitrary. There are, in the initial group, several men acknowledged as leaders (who likely acquired this reputation from their behavior during the nomadic life) and who make the relatively stable nuclei around which the different aggregates center. The importance, as well as the permanence of the aggregate through successive years, depend largely upon the ability of each of these leaders to keep his rank and eventually to improve it. Thus, it may be said that leadership does not exist as a result of the band's needs, but, instead, that the band receives its shape, its size, and even its origin, from the potential leader who antedates it.

There is, however, a continuous function of leadership, although not permanently assumed by the same individual. Among the Nambicuara, chieftainship is not hereditary. When a chief grows old, or is taken ill, and when he does not feel able to fulfill his heavy duty any more, he himself designates his successor. "This one—this one will be the chief . . ." he says. It seems likely that this autocratic power to insure one's own succession is more apparent than real. We shall emphasize later on the small amount of authority enjoyed by the chief and, in this case as in many others, the final decision is probably preceded by a careful survey of public opinion, the designated heir being, at the same time, the one with the greater support from the members of the band. The appointment of the new chief is not only limited by the wishes or disapproval of the band; it needs also to correspond to the plans of the individual to be chosen. Not seldom, does the offer of leadership meet with a vehement refusal: "I don't want to be the chief." Then a new choice must be made. As a matter of fact, chieftainship does not seem to be coveted by many people, and the general attitude of the different chiefs I happened to know was less to brag about their

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

622 importance and authority than to complain of their many duties and heavy responsibilities. What, then, are the privileges of the chief, and what are his obligations?

When, about 1560, the great French moralist of the sixteenth century, Montaigne, met in Rouen with three Brazilian Indians brought there by some navigator, he asked one of them what were the privileges of the chief (Montaigne said, "the King") in his country; and the native, himself a chief, answered: "To walk ahead on the warpath." Montaigne related this story in a famous chapter of the *Essays* where he wondered a great deal about this proud definition*; but it was a greater wonder to me when, almost four centuries later, putting the same question to my informants I was given the same answer. Civilised countries are certainly not accustomed to such constancy in the field of political philosophy! Striking as it may be, this answer is less significant than the name by which the chief is designated in the Nambikuara language. *Uilikande*, the native word for chief, seems to mean "the one who unites" or "the one who joins together." This etymology suggests that the native mind is fully conscious of this extremely important phenomenon which I have pointed out from the beginning, namely, that the leader appears as the cause of the group's willingness to aggregate rather than as the result of the need for a central authority felt by a group already constituted.

Personal prestige and the ability to inspire confidence are thus the foundations of leadership in Nambikuara society. As a matter of fact, both are necessary in the man who will become the guide of this adventurous experiment: the nomadic life of the dry season. For six or seven months, the chief will be entirely responsible for the management of his band. It is he who orders the start of the wandering period, selects the routes, chooses the stopping points and the duration of the stay at each of them, whether a few days or several weeks. He also orders and organizes the hunting, fishing, collecting and gathering expeditions, and determines the conduct of the band in relation to neighboring groups. When the band's chief is, at the same time, a village chief (taking the word village with the restricted meaning of semi-permanent dwelling for the rainy season), his duties do not stop there. He will determine the moment when, and the place where, the group will settle; he will also direct the gardening and decide what plants

* Michel de Montaigne. "Des Cannibales." Essais. Livre I, XXXI (End of the chapter).

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

are to be cultivated; and, generally speaking, he will organize the occupations according to the seasons' needs and possibilities. 622

These rather versatile duties, it should be pointed out from the start, are not facilitated by any fixed power or recognized authority. Consent is at the origin of leadership, and consent, too, furnishes the only measure of its legitimacy. Disorderly conduct (according to the native standards) and unwillingness to work on the part of one or two discontented individuals may seriously jeopardize the chief's program and the welfare of his small group. In this eventuality, however, the chief has no coercivitive power at his disposal. The eviction of the bad people can take place only in so far as the chief is able to make public feeling coincide with his own opinion. Thus, he must continuously display a skill belonging more to the politician trying to keep hold of his fluctuating majority than to an over-powering ruler. Furthermore, he does not only need to keep his group together. Although the band lives practically alone and by itself during the nomadic period, the existence of the other bands is not forgotten. It is not enough to do well; the chief must try—and his people count on him for that—to do better than the others. [627]

No social structure is weaker and more fragile than the Nambikuara band. If the chief's authority appears too exacting, if he keeps too many women for himself (I shall later analyse the special features of the chief's polygamy), or if he does not satisfactorily solve the food problem in times of scarcity, discontent will very likely appear. Then, individuals, or families, will separate from the group and join another band believed to be better managed. For instance, this band may get better fare from the discovery of new hunting or gathering emplacements; or it may have become richer in ornaments or implements, through trade with neighboring groups, or more powerful as a result of a successful war expedition. The day will come when the chief finds himself heading a group too small to face the problems of daily life, and to protect his women from the covetousness of other bands. In such cases, he will have no alternative but to give up his command and to rally, together with his last followers, a happier faction. Therefore, Nambikuara social structure appears continuously on the move. The bands take shape, then disorganize, they increase and they vanish. Within a few months, sometimes, their composition, number and distribution cannot be recognized. Political intrigues within the same band and conflicts between bands impose their rhythm upon these fluc- 621 622

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

[521] tutions, and the ascent or decline of individuals and groups follow
522 each other in a rather surprising manner.

How will the chief be able to overcome these difficulties? The first instrumental force of his power lies in his generosity. Generosity —an all important feature of chieftainship among most primitive peoples, especially in America—plays an outstanding part even on those crude cultural levels where worldly goods are limited to the most primitive weapons and tools, coarse ornaments made of feathers, shells and bones, and raw materials, such as lumps of rosin and wax, hanks of fiber and splinters of bamboo for arrow-making. There cannot be great economic distinctions between families each of which can pack [462] all of its belongings in the baskets carried along by the women during [558] the long travels of the dry season. But, although the chief does not seem to fare better, in this respect, than the others, he must always have at hand surpluses of food, tools, weapons, ornaments which, while being small indeed, acquire great value because of the scarcity which is the prevalent condition. When an individual, a family or the band itself needs or covets something, the chief is called upon to secure the desired article. Generosity is the quality, much speculated on, which is expected of a new chief. Generosity is the string constantly struck which makes the general consent to one's leadership sound clear or out of tune. There is little doubt that, in this respect, the chief's ability to give is exploited to the utmost. Band chiefs used to be my best informants, and, well aware of their difficult position, I liked to reward them liberally; but I seldom saw one of my many gifts remain in their hands for more than a few days. Each time I took leave of a band, after a few weeks or a few months, its members had time to become the happy hoarders of axes, knives, beads, and so on. As a rule, however, the chief was exactly as poor as at my first arrival. Everything he had received from me (and this was considerably more than the average) had already been squeezed out of him. This collective greediness not seldom drives the chief to an almost desperate position; then the refusal to give plays about the same part, in this primitive democracy, as the threat to resign followed by a vote of confidence in a modern parliament. When a chief reaches the point where he must say: "To give away is over! To be generous is over! Let another be generous in my place!", he must, indeed, be sure of his power and prestige, for his rule is undergoing its severest crisis.

Ingenuity is but the intellectual form of generosity. A great deal

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

of skill and initiative are the prerequisites of a good leader. It is he who makes the arrow-poison, although the preparation of *curare* among the Nambikuara is a purely profane activity surrounded by no ceremonial taboos or magic prescriptions. It is he, also, who makes the rubber ball used in the head-ball games which are played occasionally. The chief must be a good singer and dancer, a merrymaker always ready to cheer up the band and to brighten the dullness of daily life. This could easily lead to shamanism; and, in some cases, I have met with chiefs who were at the same time healers and trance addicts. Mystical life, however, is kept in the background among the Nambikuara, and, wherever they exist, magical functions are only secondary attributes of the leader. More often chieftainship and sorcery are divided between two different individuals. In this respect, there is a strong difference between the Nambikuara and their northwestern neighbors the Tupi-Kawahib among whom the chief is, first of all, a shaman, usually a psychotic addicted to dreams, visions, trances and impersonations.

But although they are oriented in a more positive direction, the Nambikuara chief's skill and ingenuity are none the less amazing. He must have a perfect knowledge of the territories haunted by his and other groups, be familiar with the hunting grounds, the location of fruit-bearing trees and the time of their ripening, have some idea of the itineraries followed by other bands, whether hostile or friendly. Therefore, he must travel more, and more quickly, than his people, have a good memory, and sometimes gamble his prestige on hazardous contacts with foreign and dangerous people. He is constantly engaged in some task of reconnoitering and exploring, and seems to flutter around his band rather than lead it.

Except for one or two men without actual power, but eager to cooperate and to receive occasional rewards, the passivity of the band makes a strong contrast with its dynamic leader. It seems as if the band, having relinquished certain advantages to the chief, were in exchange relying entirely upon him for its interests and safety. I received a particularly striking demonstration of this under rather strange circumstances. After several weeks' discussion, I had obtained from a chief the favor of taking me, together with a few companions and some animals loaded with presents, to the semi-permanent dwellings of his band which were uninhabited at that time. This was a chance for me to penetrate more deeply into the unexplored Nambikuara territory

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

622 and to meet groups too shy to venture forth on the outer fringe. The native band and my own group set out together on a journey supposed to be short; but, because of the animals I had taken, the chief had decided that the usual route through a dense forest could not be used. He led us through the open country, lost his way several times, and we did not reach our destination on the scheduled day. Supplies were exhausted and no game was in sight. The not unfamiliar prospect of a foodless day fell gloomily upon the natives. But, this time, it was the chief's responsibility. The whole project was his own, as well as the attempt to find an easier route. So, instead of trying to discover food, the hungry natives simply lay down in the shadow of the brush and waited for their leader to take them out of this most unpleasant situation. He did not wait or discuss; but, taking the incident as a matter of course, he simply left the camp accompanied by one of his wives. At the camp, the day was spent sleeping, gossiping and complaining. There was no lunch or dinner. But, late at dusk, the chief and his wife reappeared, both heavily laden with baskets filled to the brim. They had hunted grasshoppers the entire day, and, although the expression "to eat grasshoppers" has approximately the same meaning in Nambikuara as the French *manger de la vache enragée*,[6] this food was enthusiastically received, shared and consumed, amidst restored good humor. The following morning, everybody armed himself or herself with a leafless twig and went grasshopper-hunting.

[262]

622 595 I have several times referred to the chief's wives. Polygamy, which is practically the chief's privilege, brings him a moral and sentimental reward for his heavy duties together with the practical means of fulfilling them. In the Nambikuara band, apart from rare exceptions, only the chief and the sorcerer (when those functions are divided between two individuals) may have several wives. The chief's polygamy, however, presents special features. It does not constitute a plural marriage but rather a monogamous marriage to which relations of a different nature are added. I have already mentioned the fact that cross-cousin marriage is the usual pattern among the Nambikuara. Another type of marriage also exists, between a man and a woman belonging to the generation following his own, either a wife's "daughter" (true or classificatory) or a sister's niece. Both forms are not uncommon in South America and, together or separately, they have been re-

[6] Closest English equivalent: "to have a rough time of it, to go through the mill."

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

corded among many tribes. Now, what do we find in the chief's case? There is first a monogamous marriage of the cross-cousin type, that is, where the wife belongs to the same generation as her husband. This first wife plays the same part as the monogamous wife in ordinary marriages. She follows the sexual pattern of the division of labor, taking care of the children, doing the cooking, and collecting and gathering wild food. To this marriage are added one or several unions, which, technically, are true marriages, but of a different type. Usually, the secondary wives belong to a younger generation. The first wife calls them daughters or nieces. Besides, they do not follow the sexual pattern of the division of labor, but share indifferently in men's or women's activities. At the camp, they disdain domestic tasks and remain idle, either playing with the children to whose generation they belong or flirting with their husband, while the first wife keeps busy with the food and the fire. On the contrary, when the chief leaves on an exploration, a hunt, or some other manly task, they will accompany him and bring him their moral and physical help. These somewhat "tomboy" girls, elected by the chief from among the prettiest and healthiest of the group, are to him rather "girl-friends" than spouses. They live on the basis of an amorous friendship which contrasts strongly with the more conjugal atmosphere of the first marriage.

This system exerts a tremendous influence upon the whole life of the group. The periodical withdrawal by the chief of young women from the regular cycle of marriages creates a permanent unbalance within the group, between the number of boys and girls of marriageable age. Young men are the chief victims of that situation and must either remain bachelors for several years or marry widows or old women discarded by their husbands. Thus, the right to plural marriages represents a concession of considerable importance made by the group to its leader. What does it mean from the latter's point of view? There is little doubt that access to young and pretty girls brings him a much appreciated gratification, not so much from the physical side (as the Nambikwara share in the quiet dispositions of most South American tribes), as from the psychological and sentimental one. But, above all, plural marriage, together with its distinctive features, constitutes the technical means and the functional device placed at the chief's disposal by the group to enable him to carry out his exacting duties. Left by himself, he could hardly do more than the others. His secondary wives, freed by their special status from the customary

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

622 595 182 abilities of their sex, are his helpers, comforters and assistants. They are, at the same time, leadership's prize and instrument. Can it be said, from the native point of view, that the prize is worth the trouble? To answer that question, I shall now have to consider the problem from a broader angle, namely, what does this elementary social structure, the Nambikuara band, teach us about leadership, its basis and its function?

121 There is a first point which does not require great elaboration. Nambikuara data contribute, with many others, to destroy the belief originated by early anthropologists, and temporarily revived by psychoanalysis, that the primitive chief could find his prototype in a symbolical father, and that the simpler forms of the State could progressively have grown out of the family. We have found at the root of the crudest forms of chieftainship a decisive step, which introduced something entirely new in respect to biological relations—and this step consists of *consent*. Consent, we have seen, is at the same time the origin and the limit of leadership. Unilateral relations such as right of age, autocratic power, or others, may appear in groups having an already complex structure. In simple forms of social organization, such as the one I have tried to describe, they are inconceivable. Here, on the contrary, the relationship between the chief and the group can be seen as a perpetual process of arbitration where the chief's talents and authority on the one hand and the group's size, cohesion and willingness, on the other, constantly react on and influence each other. If I had the time, and if it were not so far removed from my topic, I would have liked to show what considerable support modern anthropological observations bring, in this respect, to the analysis of the eighteenth century social philosophers. I am well aware of the fact that Rousseau's "social contract," which is the step by which individuals resign their autonomy in favor of the General Will, is entirely different from the nearly contractual relations existing between the chief and his followers. It remains true, however, that Rousseau and his contemporaries displayed a keen sociological feeling when they understood that cultural attitudes and elements such as "contract" and "consent" are not the result of secondary processes, as claimed by their opponents; they are culture's raw materials, and it is impossible to conceive a political or social organization in which they would not already be present. If I understand correctly, the recent analysis, by modern American

missaries had not yet learned enough Iranxe to make working with informants possible.

As all of the following information, unless otherwise specified, relates to the Wakitáun band, a short description of this band is in order. Today the band consists of 18 individuals, of which Julio is the chief. About 5 years ago, before a measles epidemic decimated it, the band was roughly twice the size it is today. Julio is a man of middle age, has three wives and two children, and probably holds his leadership by being the strongest and ablest man in the band. Except for one of Julio's wives and her daughter who are Eléteare, the members of the band are Wakitáun and related to one another. Julio took the Eléteare woman from the Eléteare band by killing her husband. He claims he did this because the Eléteare chief stole one of his wives some years ago. He claims he is going to steal another wife, for every chief is supposed to have four. Only three other men, Martín, Mariano, and Joaquín, are married, each having one wife. The remaining four are either widowers or as yet unmarried.

Of all the Indians which I have visited in Mato Grosso the members of this band of Nambicuara were the most miserable. Of the eight men, one had syphilis, another had some kind of infection in his side, another had an injured foot, another was covered with some kind of scaly skin disease from head to foot, and another was deaf and dumb. The women and children, however, appeared to be healthy. Owing to the fact that they use no hammocks but sleep on the ground, they are always covered with dirt. On cold nights they remove the fleas and sleep in the warm ashes. The Wakitáun wear clothes only when they are given by the missionaries, who ask that they be worn. Their distaste for bathing permits not only a covering of dust and ashes to accumulate on their skin and hair but also particles of decayed meat and fish, which, combined with stale sweat, makes proximity to them rather distasteful. They also appear to be heavily infected with internal parasites, for their stomaches are distended and they are continually passing wind. On several occasions when a number of them had crowded into the small room we used for working we had to cease work in order to air the room.

In their manners the Nambicuara also contrast sharply with the other tribes I visited. The

4: Oberg E-5 (1949) 1953
SP17 Nambicuara SP17

GH 773

to grow maize and sweet potatoes. He also gave them the flute (sabarbe), and taught them how to sing and dance. Childbirth is thus the culture hero of the Nambicuara. In human form he looks like a Nambicuara Indian, wears ornaments in his ears, nose, and upper lip and paints himself with urucú. Yet today people no longer see childbirth, for he has gone away. They do not have rituals connected with him, nor do the shamans exhibit his aid. But the stone mountain from which the Nambicuara came is still recognized as the place of the dead. On ceremonial occasions the ghosts of the ancestors come to the encampments and villages from the mountain, returning after they have been given food.

●622 Although every band has a leader or chief it is not quite certain whether these leaders get their positions through succession or by personal strength and prestige. Julio claimed that he is headman because his father was a headman, but the other members of the Wakitáire band claim that the strongest man is always the leader by common agreement. The Nambicuara appear to value two qualities in a man—"a strong body" and "a strong mouth." The chief is like a tapir (aldeare) which is the strongest of the animals; thus, a chief is called alexatidesare. A shaman gains power by talking or by having "a strong mouth," as the Nambicuara say. The strongest man is one who combines these qualities and is at once a strong man and shaman—he becomes an important chief.

The survival of the band, the Nambicuara believe, depends upon the alexatidesare. He is the band leader, the band farmer, the one who organizes trade between the bands, the ceremonial head, the war leader, and the settler of disputes. Every successful chief is supposed to have four wives but otherwise has nothing to distinguish him from the rest of the tribesmen.

619 Relationships between the bands of the Eastern Nambicuara are characterized by intermarriage, trade, occasional joint ceremonies, and wife stealing and consequent armed conflicts. Intermarriage occurs when cross cousins are not available for marriage within the band. The Chiwtáire and Higaídon obtain pots from the Western Nambicuara in exchange for war, feather ornaments, beads, and bows and arrows. These pots they in turn exchange with the Eastern Nambicuara bands for knives, axes, and tin cans.

[582] 438 619

When one band wants to meet another in order to exchange goods the approach is made in a very formal manner. The approaching band stops

[p. 96(B)]

621 Eitsaw band. This is the custom among all the Eastern Nambicuara bands.

601 The kinship terminology belongs to the bifurcate merging type. The term tapaisaw (grandfather) and the term pantakitsiw (grandmother) are extended to the brothers and sisters of one's grandparents. The term eatsaiw (father) and the term ekakisaiw (mother) are extended to father's brother and mother's sister, respectively. Father's sister is termed ekatsaiwa and mother's brother eatsaiwa. A man calls his elder brother ekandwaiw, his younger brother dandidaiw, and his sisters eandaiwa, these terms being extended to parallel cousins. The terms for son (ekiwdu) and daughter (ekwaiw) are extended to the children of a man whom ego calls brother. The terms for sister's son and daughter are awaiw and aitsiw, respectively, these terms being extended to the children of anyone whom ego calls sister. The term for male cross cousin is awiwa and that for female cross cousin, dandu. There is just one term for grandchildren, pantadiwawa.

The only affinal kinship terms which we could obtain were the terms wife (eaiw) which bears a close relationship to female cross cousin; husband (awandiw); and the terms for father-in-law (aetsawa), and mother-in-law (ekatsawa), which are identical to the terms for mother's brother and father's sister. Whether women employ different kinship terms was not ascertained owing to the fact that the women refused to discuss the matter and the male informants persisted in going to sleep when the subject was broached.

532 The kinship terminology supports the statement made by the Nambicuara that cross-cousin marriage is preferred. Excepting one Eitsaw woman all the wives in Julio's band were Wakihiru and cross cousins of their husbands. At the death of

587 the husband the wife and children pass to the
708 deceased husband's brother. Women sometimes marry their mother's brothers. Residence is patri-

591 local although when marrying a woman from another band, the man sometimes remains with his wife's band for a while. Band membership, as has been stated, is determined by matrilineal descent.

● 622 The powers of the chief are limited to leadership in such activities as hunting, planting, trade, and ceremonies. Bands, although organized by the chief, are not led by him. The chief admon-

[p. 99(A)]

The chief advises
627 [623] ishes quarrelsome individuals but appears to have no powers of coercion. The Wakitáun claim that individuals quarrel but they do not fight among themselves nor do they remember any cases of murder. Unwanted individuals are exiled by common agreement. Houses, fields, and some implements are common property, and food is shared among the members of the band. Axes, machetes, and knives, although owned by individuals are freely used by other members. At death, privately owned tools pass to a man's sons or to his brother. The bow is customarily broken and left on the grave. Even these rules are not strictly adhered to, for when a man becomes seriously ill other men begin to help themselves to his property and the one with the "strongest mouth" gets the most. If the man recovers he cannot reclaim his things but must set about accumulating a new supply.

The wife and the children are under the strict control of the husband. Although boys must obey their fathers they owe no special obedience to their mothers. Boys sometimes throw stones and sticks at their mothers and the old women; the older men not only laugh but even encourage this disobedience. The bond between brothers is very close. On occasion they share each other's wives. No particular respect is paid to in-laws.

RELIGIOUS BELIEFS AND PRACTICES

According to the Wakitáun the spirits are the source of all danger, misfortune, sickness, and death. The ghosts of the dead (*epitehúlou*), bring sickness unless offerings of food are made to them. The ghosts of dead shamans (*owáwa*), belonging to other bands bring thunderstorms which destroy gardens and make hunting difficult. In addition to the ghosts, there is *tsupté*, the hawk of death who lives in the sky, and *wáwi*, the evil armadillo who lives under the ground and wants to destroy the villages and camps of the Nambicuara.

Tsupté is an enormous hawk with huge wings, tail, and claws, who sits in a tree made of human bones. This tree (*hálukutsu*) is situated on the shore of a shallow lake in the sky. Shooting stars are caused by *tsupté* defecating at night. A small red bird (*dindiwasu*), who lives with *tsupté*, urinates into the lake and when it fills up the urine overflows and comes down in the form of rain.

[p. 99(a)]

854 Children are treated with great affection and refused nothing. They are rarely punished. Many an Indian, already elderly would walk for leagues [256] with a child on his back to come to us and give the little one some of the presents we were distributing.

622 They have no clearly defined chiefs. Some men the muleteers call chiefs are merely individuals of some influence frequently heeded by the others.

578 622 One day, in Campos Novos, we were visited by the Cocozu and Anunze. Several young men of both groups spent the night there: Nuleke, Krikricekmerá (Manduca), Paixão, Preguiça [Port. "sloth], Damasceno, and the famous Cavagnac, supposed chief of the Urutau village, a scoundrel who used to ambush the muleteers on the Line and take their packs.

On the following day many Uaintaçu came; they were bold, rough, and quite unpleasant people.

The others, when they saw the Uiantaçu approaching, gave signs of agitation. Finally the Uaintaçu arrived, very much excited by the presence of our guests. An endless discussion ensued among the three groups. They all talked and gesticulated in angry fashion, with gleaming eyes, ready to attack each other. Fearing a conflict which would be disastrous on every count, we intervened by distributing cigarettes, matches, axes, etc., in order to distract them. They calmed down. But some of the Cocozu and Uaintaçu boys continued to argue and were gradually surrounded by the others who listened attentively. Two on one side would speak; two from the other side would reply. The two Indians who talked, Damasceno and Cavagnac, were more intelligent, clever and bold. There was nothing to indicate that they were true chiefs, recognized as such on every occasion. They were temporary chiefs.

622 Among the Tagnani and Tawite, on the other hand, there are clearly defined secular chiefs. One of them stood out because he wore no ornaments whatever [257]. He actually commanded and was obeyed by all. He had three wives.

562 The status of the Nambicuara woman is not so degraded as that of other Brazilian Indian women. She works hard, it is true. She [62] gathers fruit, grates manioc, handles the mortar and pestle, erects the hunting shelters, spins cotton, carries the family belongings, cares for the children, takes part in cultivating the plot; but usually she is

836 who seem to be susceptible to violent passions. We knew an Indian who fled with a Paresi Indian girl during our stay, and lived with her for several months hidden in the bush and fleeing the husband who was in hot pursuit after them. Here is the way an informant (B15) tells of a former adventure. He reconstructs a dialogue with the beloved woman:

51. ajndarinjẽ — otendnjẽ — ajdoteha ajdakanjajni numadajẽ ajrhajtasirndige tamintednjẽ (b1)
Do you want to make love?--I do not wish to.--You are worth nothing! I want to make love or I will kill you! Let us go make love.

Very anxiously the woman responds:

higekanhẽ najrirẽ najrideднjẽ etjẽdahẽ dungrajeni (b1)
Do it quickly, my husband will be angry, he will beat me.

There is no social sanction against adultery; but the wronged husband can avenge himself in a fearful manner and in circumstances of this type poison, used either against the wife or against the lover, plays its role. In order to avoid such incidents, the companions intervene between the adversaries and counsel the seducer to disappear for a while:

52. ijehetnjẽ ajkuakatednjãni ekuide ekuide ekuide ekuide ekuide ekuide ekuide ekuide kajidodni usiknereniani (b1)
Go away.--I am going far away.--When this moon is ended and that one, and that one, and that one, and that one, and that one, and that one, and that one, then, in that one, you may return.

We knew an Indian (C11) whose wife disappeared one day, having left with a member of his group. He thought first of revenge, but his companions intervened, and it was finally decided that the lover should keep the wife and would give him a dog as compensation. Several months later, the lover died (we were not able to find out whether the death was normal or accidental), and the woman returned to her husband, who said he was very happy to have acquired the dog also. This story should not be interpreted in the sense of an equivalence, conceived by the Indian spirit, between a woman and a dog. We have insisted too much on the fundamental role of the woman in Nambikwara life to have to return to that here. But in groups where trade [112] exists in such a primitive form (1) exchanges of goods have as a

1. Cf. p. 93 f.

[634] [626] [183] conscious function the bringing of psychological compensations incommensurable among themselves, rather than for establishing equivalences of value.

744 184 The Nambikwara have two types of burial. The eastern groups practice double interment. The bodies are first placed in a crouching position (ãrigaerekitiru, al) in a circular ditch (sinitukuriu, al) seven feet deep heaped up with earth and branches. For two months, they sing, dance and weep around this provisional tomb, until the body is decomposed. Then the bones are carried to the river where they are carefully washed. Then they are carried in [768] a cloth to be permanently buried in the village. The village is then abandoned, but the site is often visited:

53. agegande ãjunikere kadukitrage jaxtige ende ende ende inare inaretaire jinoribate (bl)
to dig the grave, to close it, to wait one moon, one moon, one moon, to take out the bones, to bury them in the village.

In the central groups, on the other hand, the bodies would be buried (aoʔenikere, bl) in a prone position (jotarige, bl).

The funeral rites distinguish between movable goods and immovable goods. The first are carefully destroyed; they break and burn the weapons; they unravel the beads and necklaces.

[748] The garden of the dead man, if he cultivated one, is, however, only abandoned, and can be reclaimed later:

54. dõore dutige atiede aitadutige aidoutahãmdige aidoxaãmde odeneheje odumbande njaxtumnje narajnidande narajdutige aitedugejottige den den den nagiaode aire dugiotige tianugiotige (bl)
The arrows are broken, everything must be broken the beads are unstrung, the beads of the deceased, the fields of the deceased are abandoned one moon, one moon, one moon, and when all is forgotten, another takes the field.

423 Yet it is necessary to avoid confusion on this point. Strictly speaking, there is no land property among the Nambikwara. The chief invites his men to group together to cultivate the gardens, but sometimes such and such an individual decides to clear a field on his own account. These personal appropriations do not give rise to any incidents since the cultivatable land is usually far larger than the collective needs. However, a garden represents a value, because of the considerable amount of work spent in clearing it, especially for people who have never seen metal tools until 30 years ago. Also the rule of destruction of the goods of the deceased respects the

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

are to be cultivated; and, generally speaking, he will organize the occupations according to the seasons' needs and possibilities. 622

These rather versatile duties, it should be pointed out from the start, are not facilitated by any fixed power or recognized authority. Consent is at the origin of leadership, and consent, too, furnishes the only measure of its legitimacy. Disorderly conduct (according to the native standards) and unwillingness to work on the part of one or two discontented individuals may seriously jeopardize the chief's program and the welfare of his small group. In this eventuality, however, the chief has no coercivitive power at his disposal. The eviction of the bad people can take place only in so far as the chief is able to make public feeling coincide with his own opinion. Thus, he must continuously display a skill belonging more to the politician trying to keep hold of his fluctuating majority than to an over-powering ruler. Furthermore, he does not only need to keep his group together. Although the band lives practically alone and by itself during the nomadic period, the existence of the other bands is not forgotten. It is not enough to do well; the chief must try—and his people count on him for that—to do better than the others. [627]

No social structure is weaker and more fragile than the Nambikuara band. If the chief's authority appears too exacting, if he keeps too many women for himself (I shall later analyze the special features of the chief's polygamy), or if he does not satisfactorily solve the food problem in times of scarcity, discontent will very likely appear. Then, individuals, or families, will separate from the group and join another band believed to be better managed. For instance, this band may get better fare from the discovery of new hunting or gathering emplacements; or it may have become richer in ornaments or implements, through trade with neighboring groups, or more powerful as a result of a successful war expedition. The day will come when the chief finds himself heading a group too small to face the problems of daily life, and to protect his women from the covetousness of other bands. In such cases, he will have no alternative but to give up his command and to rally, together with his last followers, a happier faction. Therefore, Nambikuara social structure appears continuously on the move. The bands take shape, then disorganize, they increase and they vanish. Within a few months, sometimes, their composition, number and distribution cannot be recognized. Political intrigues within the same band and conflicts between bands impose their rhythm upon these fluc- 621 622

The chief advises

601 up to the present time. We do not pretend to found a dualistic theory of organization (2) on these limited observations whose

2. This point has been developed before; cf. "Dual organization etc.," loc. cit.

character remains anecdotal. However, we are indeed in the presence of one of those cases where "the fundamental traits of the clan organization are found, in a certain measure, to be preformed in tribes destitute of clan (3)." It would suffice, to

3. R.H. Lowie, "Family and Sib," American Anthropologist, N.S., Vol. 21, 1919, pp. 28-40.

satisfy the exigencies of dualistic organization, that the new group should settle down, and maintain the memory of its ambiguous origin by continuing to avoid confusing the two sets of fires.

Finally, this system manifests, under a new aspect, this preponderance of men which we have called attention to as regards inter-individual relationships. It is through the men that alliances of groups are decided, as also eventually, their wars.

• • • •

600 The preceding remarks have perhaps another interest: that of suggesting an interpretation of observations of a sociological character which one finds scattered in the ancient literature relating to South America.

601 171 One should first note some striking analogies between certain traits of the Nambikwara kinship system and those which can be attributed to the family organization of the ancient Tupi of the Brazilian shore. It will be seen later that, on the metaphysical plan, there are not only themes common to the two cultures, but that such religious terms of the Nambikwara vocabulary have an evident Tupi origin. Each time that we are to describe the small incidents of the daily life of the Nambikwara, the temptation is almost irresistible [80] to quote Jean de Léry and Yves d'Evreux, for it is so true that the same words of these old authors can literally be applied to one culture, later by four centuries. But it is in the kinship system that the resemblances are the clearest: the two cultures invoke

622 he is incapable of satisfying increasing demands, and must refuse firmly:

32. kʼinde hõta agnãre hõta (bl)
The giving is finished! Being generous is finished!

[86] or must even pose the question of confidence:

33. duhʼĩri (gi) dnje̊ tunundje̊ tundzentine hãknerejane (bl)
Go away! Giving is done with! Let another be generous (in my place)!

622 However it evidently depends on his ability and moderation whether
648 or not these refusals keep the demands of his companions within reasonable limits or provoke discontent and resulting ruptures. Under these conditions, the relationships which the chief succeeds in cementing with the outside world—other Nambikwara bands and neighboring tribes—have extreme importance. The chief has traveled widely. Within the limits of his territory, he has visited tribes different from his own and which his companions know only through his commentaries. We ourselves have had the impression of being used for political purposes: we have told above what the reactions of A1 were as regards writing. (1) He wished on this basis to attempt a vast operation, and

1. See above, p. 40 f.

he united several related bands under the pretext of meeting us, begging us without explanation to postpone the exchange of objects with the Indians. This enigmatic attitude lasted till the day when, assembling all his guests in a circle, he exhibited a piece of paper covered with wavy lines, and made a pretense of reading to each individual the nature and importance of the present which I was supposed to give to each one. All that with my complicity, obviously stupefied and immediately acquired. The Indians were even more impressed. The plan, such as we were able to understand it, consisted of fortifying his power by presenting himself as the sponsor and protector of the white visitor, whose secrets he was reputed to know at the same time. But the card of civilization thus played is assuredly vain. Six months later, we found A1 at the head of a severely reduced group and without illusion as to the failure of his vast projects. He watched us leave with real sadness, as though he were losing, with us, the last vestige of his prestige.

622 The charges of leadership being presented under such unattractive colors, one might ask what makes an individual accept them. It was not possible for us to determine exactly what the modalities are to be

1: Levi-Strauss--105 E-8 (1938-1949)1948 SP17 Nambicuara SP17

622 The command carries, moreover, a certain number of fixed offices. It is the chief who makes the poison for arrows; and he presides over ceremonies of initiation, of marriage or burial, concerning which we shall speak later. He organizes chants and dances, festivals both when they assume a ritual character, and when they have as a goal purely secular distraction. It is he who organizes 622 ball games. The ball game is widespread in western and northern 526 Mato Grosso, for it is found from the Xingu to the tribes of the Lower Guaporé. Among the latter people we have been able to gather evidences of its sociological significance. It is perhaps the same among the Nambikwara; but, at least during the period of nomadic life, the ball game is practiced with a purely recreational goal in mind. The teams are built up haphazardly from those present and upon the spur of the moment, and the game takes place in a spirit of complete improvisation.

WAR AND TRADE

648 The two subjects should be treated simultaneously, commercial 609 exchanges usually representing potential wars peacefully re-[91] 439 solved, and the wars, the outcome of unhappy transactions. Among the numerous bands which cross through the bush during the dry season, it is necessary to distinguish those who are related by family ties, and who often represent the population of a winter village—or of a group of villages—which has "burst forth" in the pursuit of the nomadic life. Among themselves these bands entertain relationships which are normally pacific, although not necessarily so. On the contrary, bands which are strangers to one another, composed of members not related among themselves and whose geographic location is far distant, or who are even separated by differences of language, mistrust one another at the same time that they feel themselves necessary to one another. Only when they meet can they procure desirable articles which only one of them is capable of obtaining or of making. These articles seemed to us to belong essentially to three categories: first of all women, whom only victorious expeditions are permitted to carry off. Next seeds, notably bean seeds, and finally ceramics, or [283] even fragments of pottery used to make the weights of spindles. Group [84] al whose cultural level is clearly inferior (especially in its ignorance concerning pottery) to that of its western and southern neighbors, according to the word of its chief, had carried on several campaigns during the last few years with the goal of procuring these two last articles.

•648 609 Also, the attitude of two bands who know that they are neighbors is very significant. They fear the clash of contact, and at the same time they desire it. In fact, they cannot meet one another accidentally, for for several weeks they watch the vertical smoke from the campfire which rises, perfectly discernable at some twenty kilometers, into the middle of the clear sky of the cold season. It is one of the most impressive spectacles of the Nambikwara territories when towards evening this smoke suddenly fills a horizon which one had thought deserted. Is the band which approaches friend or foe? They do not know, and they discuss at length their course of conduct. For days or weeks they avoid one another by maintaining a reasonable distance between the fires, then one day, according to whether the contact appears inevitable, desirable, or necessary, the women and children scatter in the bush and the men leave to face the unknown. We attended one of these "encounters" (nakohatigge, bl). A long conversation is entered upon (dekihotige, bl) between the two bands reduced to their masculine elements, or more exactly, the leaders undertake, in turn, a sort of prolonged monologue, composed of exclamations, uttered one after another, in a tone at the same time plaintive and tearful, where the voice rises and trails off in nasal fashion at the end of each word. The group animated by warlike intentions exposes its grief. The peaceful protest their good intentions. It was not possible for us to reconstruct thee word for word translation of this discourse. However, we give hhere the Indian text, insofar as we have been [92] able to get it, , and its approximate translation, for the purpose of showing the cconstruction and specific tone:

[537] 38. One group begins: njarondigẽ ninokuẽ. --"We are very irritated! you are our enemies!" And, after a series of exclamations of this type, the other replies: iã oraẽ touadeẽ nuhaigigiẽn nukenaetiẽ nukenaiñ' nukenitenohiñ moladeringuiñ nagatalininiot endiguẽ. -- "We are not irritated! We are your brothers! We are friends! Your friends! True friends! We can understand onne another." (bl)

After having exchanged these peaceful protestations, the groups reform and a common encampment is organized, each group preserving its individuality and gathering together its fires, and sometimes songs and dances are organized in the courseie of which each group disparages its own exhibition to the profit of that of the other group:

1: Lévi-Strauss--1948 E-5 (1938-1939)1948 SP17 Nambicuara SP17

648 37. tamaĩn ãtne munãtiare munãtiendãtiore niaĩ' (bl)
609 The Tamande' sing well; as for me, I cannot sing well any more!
201 In one case which we witnessed, the genital tone was quickly raised with the excitement of the meeting, and the night had not yet ended before the speeches mixed with chants made an extraordinary uproar, whose significance escaped us completely. Menacing gestures were outlined, sometimes even some scuffles were produced while other Indians intervened as mediators. All of these hostile manifestations are stylized, and end as gestures calling to mind sexual parts of the body. On the part of the aggressor, menace, or the gesture of Nambikwara hostility, consists of seizing the penis with two hands and directing it towards the adversary while inflating the stomach and thrusting it out, and of flexing the knees (the men also make this gesture in fun toward children when they wish to get rid of them). The second stage consists of an act of aggression toward the person
[291] of the adversary, with a view to tearing off the piece of buriti straw attached to the front of the waist, above the sex organs. The latter "are hidden by the straw" and "they fight to tear away the straw." This action is entirely symbolic, for the covering of the male sex organs is made of such fragile material and is reduced so small in size (and often non-existent) that it is out of the question for it to assure protection of or be any kind of covering for the organs. Another form of aggression consists of seizing the adversary's bow and arrows and laying them aside. In all of these actions the attitude of the Indians is extremely tense as if they were (and really, they are) in a state of violent and contained anger. Doubtless these brawls degenerate at times into generalized conflicts, but in our case, they calmed down at dawn. Always [93] in the same state of apparent irritation, and with gestures devoid of friendship, the adversaries looked at one another to inspect one another, rapidly
[301] feeling the earrings, the cotton bracelets, the little feather ornaments, while murmuring rapid words:

38. tõhẽ tõhẽ kãhẽ kãhẽ muninĩti (bl)
Give, give, see, see, it is pretty!

648 This "inspection of reconciliation" marks the normal conclusion
439 of the conflict. And actually it is this which introduces the new aspect which the relationships between the two groups are going to take—commercial exchanges. However summary the material culture of the Nambikwara may be, the products of the industry of the different groups are highly prized by their neighbors. The eastern groups need pottery and seeds; the northern and central groups consider

that their southern neighbors make particularly nice necklaces. Also the meeting of the two groups, when it can take place in a peaceful manner, has as a consequence a series of reciprocal presents. The always impending conflict gives way to a market. This has some very remarkable characteristics in the sense that if one regards the presents only as presents, they do not bring any thanks nor proof of satisfaction. And if one considers them exchanges, they are effected without any bargaining, attempts to set the value of the article, depreciation, or manifestation of disagreement between the parties. Truthfully, they take pains not to admit that there are exchanges going on. Each goes about his usual occupations, and the objects or products go from one to the other, without the one who gives making note of the gesture by which he hands over his present, and without the one who receives paying any attention to his new wealth. In this way are exchanged husked cotton and balls of thread; blocks of wax or resin; urucu paste; shells, earrings, bracelets and necklaces; tobacco and seeds; feathers and sticks of bamboo destined for making arrow points; skeins of palm fibers, porcupine quills; whole pots or broken pottery; gourds. This mysterious circulation of merchandise goes on without haste for a half day or a whole day, after which the groups separate, and each one takes inventory of what he has received, and remembers what he has given. Thus, as regards the equity of the transactions, the Nambikwara trust entirely, the generosity of the partner. The idea that one might estimate, discuss or bargain, demand or take back is entirely foreign to them. We had promised an Indian a hunting sword as the price of transporting a message to a neighboring group. The commission was done, but upon the return of the messenger we had neglected, occupied by other cares, to give him immediately the agreed upon recompense, thinking that he himself would come to get it. He did nothing, and the next day we could not find him. He had left, very irritated his companions told us, and we did not [94] see him again. We were forced to entrust the present to another Indian. Under these conditions, it is not surprising that when the exchanges are finished, one of the groups departs discontented with its lot and, while taking inventory of its acquisitions and recalling its own presents, accumulates bitterness for weeks or months, which become greater and greater and more aggressive. It seems that wars very often have no other origin. Naturally other causes exist, such as a murder or carrying off women, depending on whether one desires to take the initiative, or whether one wishes to avenge a preceding attack; but it does not seem that a band feels

Fig. 19

[157] 747 177 648

The fact is that purely comical and sometimes childish appearances sometimes cover attitudes which, without being contradictory to the preceding, are nevertheless very different. The history of the eastern group, in the course of [134] these last years, is very significant in this regard. From 1909 to 1920, the installation of the telegraph line was marked by periodical conflicts alternating with cordial contacts, but in 1925, seven workers of the line were invited to visit (for the first time) the villages of the right bank of the Juruena River where we went later in 1938, and they disappeared there. From this time on, the contacts of the eastern group with the posts of the Rondon Line were interrupted, but in 1933 a Protestant mission was installed not far from the post on the Juruena. It seems that from the beginning relationships were quite strained, the Indians not being satisfied with the presents, very insufficient, they say, by which the missionaries paid for their help in the construction of the house and the planting of the garden. Whatever the case may have been, in 1933 a feverish Indian presented himself at the mission, and publicly received two capsules of "Cafiaspirin" which he took, after which he went to take a bath in the river, had a congestion and died. Through expert practitioners, the Nambikwara concluded that he

Lévi-Strauss--143 E-6 (1938-1939)1948 SP17 Nambicuara SP17

had been poisoned. An attack of reprisal was carefully prepared and took place, in the course of which A1 and A5 distinguished themselves. The six persons composing the mission were killed by beating or pierced with arrows, including a baby of two. Only one woman was found alive by an expedition sent to aid them from Cuiabá. The version which she gave of the events coincides exactly with that which we collected from the main protagonists of the other camp.

Poison was still to play a role in the life of A6, and this during our stay. We found ourselves visiting (August 1938) at the camp of a neighboring group (a2), and relationships became quickly strained between A6 and our hosts, undoubtedly over the question of women, so that he got the habit of coming to my camp to seek a more friendly atmosphere, at the same time that he shared my food. This fact was noticed, a delegation of four men came to find me one day, and in quite a menacing tone of voice told me to mix some poison (which they brought me along) in the next dish which I would offer to A6; they thought it advisable and indispensable to do away with him at once, for, they told me, he is "very wicked" (hakore) and "is worth nothing" (ajãkeine). I had the greatest difficulty in getting rid of my visitors without opposing them with a refusal which in turn would have exposed me to animosity which I had just learned it was better to avoid, and I considered my best plan of action to exaggerate my ignorance of the language, and to feign obstinate lack of comprehension. After several attempts, my visitors retired very disappointed. I warned A6 who immediately disappeared. I was to see him again only four months later.

These incidents are characteristic of Nambikwara psychology. The Nambikwara are very open, confident and spontaneous, but they are very sensitive and react with great violence to deception [128] or disappointment. Few primitives are as easily accessible. Few give as free access to their intimate lives, to their beliefs, daily acts, thoughts and sentiments. But despite this facility and cordiality, the visitor, be he an ethnographer or a member of a neighboring tribe—must constantly be on guard and watch his actions; for the slightest imprudence, the least clumsiness, may incite reactions difficult to evaluate among his hosts, and in connection with which recent events are always present to recall that they may be extreme. A6 offered a perfect example of this confidence and spontaneity, allied with brusk manifestations of violence and irritability.

Thus, the Nambikwara character alternately presents two aspects, or more exactly, testifies to a double nature: one which we shall call positive, and which goes much farther in this sense than among many Indians in contact for centuries with the whites; and the other, of metaphysical nature, whose rigor and exaltation at times evoke the mysticism of the North

THE NAMBICUARA

By Claude Lévi-Strauss

TRIBAL DIVISIONS AND HISTORY

101 The *Nambicuara* (*Nambikwara, Manduyara, Mahihara*) have been identified only recently. *Nambicuara*, meaning "long eared," was originally a *Tupi* nickname used since the 18th century for the little-known tribes of the western and northern parts of the Serra dos Parecis. These tribes had large ear and lip plugs, like those of the *Suya* and *Botocudo*, and were called Beiços de Pau, "Wooden Mouths," by the rubber collectors and gold miners. About 1830, they began to make hostile sorties from the region of the upper Sangue River. When, in 1907, General Candido Mariano da Silva Rondon discovered important tribes in the Serra do Norte, he identified them with the *Nambicuara* of the old literature. Thus, *Nambicuara* designates a tribe other than the "Long Ears," or "Wooden Mouths," to whom it was originally applied.

131 Extending northwest from the Papagaio River more or less to the confluence of the Commemoração and the Barão de Melgaço Rivers, branches of the Machado (Gi-Paraná) River, the region of the *Nambicuara* (map 1, *No. 2;* map 2; map 4) is bounded on the south by the right tributaries of the Guaporé River and, farther west, by the whole of the Commemoração de Floriano River. The northern boundary is unknown but probably runs more or less along the 11th parallel between the Theodore Roosevelt and Papagaio Rivers. (Lat. 10°–15° S., long. 57°–61° W.)

101 The first classification of the *Nambicuara* was made by Roquette-Pinto
197 (1938, pp. 216–217), who listed four main groups. Lévi-Strauss (n.d. b), using linguistic data, distinguishes three main groups. Two of these, which are subdivided into two groups each, clearly belong to the same linguistic family, but the linguistic affiliation of the third group, which is undivided, is doubtful. These groups are: *Eastern Nambicuara* (Roquette-Pinto's *Kôkôzu, Cocozu*) between the Papagaio and Juina Rivers; *Northeastern Nambicuara* (Roquette-Pinto's *Anuuse*) in the basins of the Camararé and Dose de Outubro Rivers; *Central* and *Southern*

½ [Not processed for the File. - Analyst]

181 Cadaveo, perhaps reminiful of their slave-owning
171 past, are proud, conceited, and boastful. The Arawak-speaking Tawaa and Paresi, like the Arawak-speaking Waurá, are quiet, unassuming, friendly, and ready to help yet take no liberties. The Umotina speak only when spoken to and appear to wish to be by themselves. They provide information if they think the gifts are sufficient and to their taste; otherwise, they saunter off and are never available when required. An Umotina does just what he wishes to do and hates any kind of dictation. The Rocairé and Camayurá are intimately friendly, talkative, and ingratiating, expect gifts and bestow gifts in return, volunteer information, are full of humor and curiosity, and are clean and polite.

181 The Nambicuara, on the other hand, are surly,
576 and impolite even to rudeness. On many occa-
609 sions when I went to visit Julio at his camp he was lying down near a fire and as he saw me approach he turned his back to me saying that he did not wish to talk. The missionaries informed me that a Nambicuara will ask for some object several times and if it is not given to him he will try to take it. In order to keep the Indians out they would sometimes close the screen door, but if a Nambicuara really wanted to enter he would tear a hole in the screen and walk in. The Nambicuara have two well-recognized ways of showing disgust or disdain. One day I stopped a woman carrying a burden basket to take her photograph. She evidently did not like being stopped, for as she passed me a moment later she turned her back to me and passed wind. This the missionaries claimed is a very common custom of the Nambicuara. The men have an even stronger way of showing disbelief and disgust. After listening to something with which he does not agree a Nambicuara will get up, grasp his penis, and slap it sharply against his groin and walk off with a "that for you" look. One might call it a Nambicuara "raspberry." Although some of these personality
181 traits are old and culturally defined, there appears
● 648 to be little doubt that the Nambicuara have a deep hatred of the white man. They realize that the white men are rich compared with themselves and that contact with the whites has brought diseases which are killing them off rapidly. They realize, too, that both the whites and the Paresi consider them in the lowest category of human beings.

[p.85(A)]

[101] The Parecí call the Nambicuara "those who sleep on the ground" and ridicule them in other ways. One does not have to remain long among the Nambicuara in order to feel this underlying hatred, mistrust, and despair, which create in the observer a feeling of depression not unmixed with sympathy.

198 The Nambicuara is the only tribe I have met who speak pidgin Portuguese, which without some training is almost unintelligible. For instance, "bastante" becomes mamade, "pequeno" becomes akiki, "grande" becomes papai, and "criança" becomes pinto. If they wish to compare two things to bring out a likeness they say this thing is the brother of something else.

192 Compared with their neighbors, the Parecí and Irantxe, the Nambicuara are taller, darker, and longer-headed. It is very easy, for instance, even at a distance, to distinguish Nambicuara children from Parecí children when they are bathing in the river. In contrast to the light brown of the Parecí skin the Nambicuara skin appears to have an element of black that gives it a dark-gray undertone. Many individuals have a certain amount of wave in their hair, although the waviness may be accentuated by the unkempt matted condition of the hair. Detailed measurements and indexes are given in Appendix 3.[1] The eyes of the Nambicuara are very dark brown, almost black in some individuals, and have a brightness which contrasts sharply with the rather dull eye of the Parecí. The only other Indians that I have met with this brightness of the eye are the Caduveo. This brilliance of the eyes does not appear to be correlated with health, for even the sick have it among both peoples.

131 The Nambicuara, as a whole, occupy a territory bounded on the east by the Papagaio River and on the west by the headwaters of the Rio Roosevelt and the Pimenta Bueno River. To the south they extend as far as the headwaters of the Rio Juruena and the Rio Kabishí. To the north they are bounded by a line running roughly from latitude 12°30′ on the Papagaio River to latitude 11° on the Rio Roosevelt. Formerly, it is believed, they extended farther northward. The telegraph line runs through Nambicuara territory beginning at Utiarity and ending at Barão de Melgaço to the west. The territory to the south and east of the Nambicuara is occupied by the remnants of the Parecí. To the north of the Nambicuara

101

[1] [See CAT·116, pp. 128-135.—A.] [p. 85(B)]

621 security and marital possibilities are endangered it will unite with some other band.

161 According to the missionaries who live in the area, the number of individuals in each band of the Eastern Nambicuara are as follows: Wakiltisu, 18; Kitânhlu, 45, Elétasu, 17; Chiwtisu, 50. Old census figures give the population of the Western Nambicuara as 500, but the missionaries assured me that they doubted whether even half [164] as many exist today. It must be remembered that an epidemic of measles or "grippe" can diminish the population very rapidly. Syphilis and tuberculosis also exist among them. Judging from the physical appearance of the individuals and their general attitude toward life, it appears that the Eastern Nambicuara, at least, are dying out rapidly.

114 According to Roquette-Pinto, perhaps the earliest visitor to the territory now occupied by the Nambicuara was Antonio Pires do Campo, who went north up the Sepotuba River, which he called Hisipotuba, between 1718 and 1723, and in all likelihood reached the headwaters of the Sacre and Papagaio Rivers. In his Breve Noticia published in 1746, he mentions the Caviro Indians living in the valleys of the rivers running northward into the Amazon River.

Some years later Padre Ayres de Casal mentions a tribe living on the Juruena River, a territory long occupied by the Nambicuara. From 1900 on, rumors about the Indians living in this area increased. In 1862, Dr. Amedée Moure published a monograph on the Indians of Mato Grosso in which he devoted a chapter to the 10 savage, man-eating tribes, among whom he listed the Umotina, Cabixi, Nambicuara, and the Tapanuma (Roquette-Pinto, 1938, pp. 26–51).

The first reliable accounts of the Nambicuara date from 1907 to 1912, the period when General Rondon was putting up the telegraph line between Cuiabá and Porto Velho. In 1912, Roquette-Pinto visited the Nambicuara and the Parecí, and later published the results of his investigations in his book entitled "Rondonia." This book undoubtedly is the first anthropologically competent report about the Nambicuara. After 1910, 648 small Government Indian Posts were established, one at Tuloua on the upper Cravarí River, a short distance east of Utiarity, and another called Pyrenevs do Sousa between Campos Novos and

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

Vilhena. These Indian Posts have had only limited success in attracting the Nambicuara, because the region is agriculturally so poor that it is difficult to grow enough food to maintain a settled population, and at present the Indians only visit these posts occasionally.

Intensive missionary activity among the Nambicuara began when two American Protestant missionaries, Arthur F. Tylee and William R. Henricks, established a mission station at Juruena in 1925. In October 1930, the Reverend Mr. Tylee, his baby daughter, Miss Mildred Kratz (nurse), and three Brazilians employed by the mission were killed by the Nambicuara belonging to Julio's band. Mrs. Tylee, although struck three or four times on the head while rushing to her child who was still in bed, was only stunned and came to after the Indians had left. One Brazilian hired man escaped to get help from the telegraph station. Some years later new Protestant missions were established at Campos Novos (Nambicuaras) and at Utiarity. At present only the mission station at Utiarity is in operation.

The Jesuits established a mission at Juruena about 1930, but in 1940 moved it to its present site in Utiarity. Today both the Protestant and Catholic missions are, therefore, located in Utiarity, which not only is connected by truck road to Cuiabá but is also centrally located. To the east and south are the remnants of the Paresí, and to the north, the Iranxe, who, although not speaking the Paresí language, appear to belong to the Arawak-speaking family. Further northward are tribes with which the missionaries are planning to make contacts. To the west are the Nambicuara. Although officially on friendly terms there is considerable tension between the Protestant and Catholic missionaries, as they are competing for the allegiance of the same Indian population.

ECONOMY

Although the Nambicuara practice a shifting agriculture, their dependence upon the wild animal and plant life of the region is so extensive that they might well be classed as nomadic hunters and collectors. The semiarid plateau provides little in the way of agricultural land, game, or fish. What little farming is practiced is carried on in the narrow "galeria" forests of the headwater streams.

[p. 87 (N)]

619 the bands. In 1937, the Kitânhlu band met a small group of Chiwtâisu out hunting and attempted to trade with them. As the Chiwtâisu were the smaller group, the Kitânhlu evidently tried to rob them. In the fight several Chiwtâisu were killed. These bands did not meet again until 1941, but the Chiwtâisu prowled around the Kitânhlu camp stealing what they could and trying to revenge their fallen comrades. In 1941, both bands happened to meet in Campos Novos, and the old quarrel was renewed. In the Chiwtâisu camp there was a child which had been born to a Kitânhlu woman married to a Chiwtâisu. A Kitânhlu took the child away by force saying that it belonged to his band. The Chiwtâisu retaliated by shooting down a Kitânhlu. A fight followed in which the Chiwtâisu were driven out after losing several of their band. For several years the Chiwtâisu remained away and were attacked by the Salâunsu, a wild tribe living to the north of the Nambicuara. In the last few years, a temporary peace has been arranged by the Chiwtâisu bringing presents of wax and honey to the Kitânhlu.

●648 Except at telegraph stations, mission stations, and at the two Indian Posts, the Nambicuara have few contacts with their neighbors, the Paresí and Iranxe. The Paresí consider the Nambicuara as their inferiors, and, as far as is known, the two peoples do not intermarry. The Iranxe hold themselves aloof from both tribes.

The efforts of the Serviço de Proteção aos Indios to improv the lot of the Nambicuara have not been very successful. Part of this lack of success is, no doubt, due to the poor agricultural possibilities in the region. The Tolosa Post is situated in a barren region where it is difficult to grow sufficient food to maintain more than two or three families. The Nambicuara visit Tolosa, but after the food supply is consumed they move on. The other factor which makes it difficult to settle the Nambicuara in permanent villages is that they are hunters and shifting agriculturists. Lack of good agricultural land does not altogether explain this nomadic pattern of existence. Like the Caduveo who have excellent farming land the Nambicuara persist in continuing their traditional form of economy.

In contrast to the Paresí, who have become satisfactory employees of telegraph stations, mining camps, and mission stations, the Nambicuara

648 only work for the white man when they want an ax, a knife, a gun, or some article of clothing, and once they obtain what they want they wander off. Miners particularly are bitter about the fact that the Nambicuara are unreliable workers.

747 Missionary activity, which has been carried on intensively by both Protestants and Catholics for about 20 years, has been singularly unsuccessful in Christianizing the Nambicuara. The Jesuit priests informed me that only those individuals who have been taken to Diamantino as children and kept there can be said to understand the rudiments of Christianity. The hope is that eventually these individuals can be brought back to the tribe and through their influence their children will be raised as Christians. The Protestants tell the same story. The Indians remain around the mission stations, participate in prayer meetings, and perform little tasks for which they are compensated but they soon become bored and wander off. The Rev. L. W. Buckman told me that he raised a Nambicuara boy at the station and believed that he would remain, but one day the boy got married, left with his wife, and took up the old wandering pagan form of life. None of the Waklítisu band are considered Christians. When Marciano died [744] a few days before I left he was buried according to Indian custom, both Protestant and Catholic missionaries participating in the burial as onlookers. Among this band which has had as much missionary contact as any, there was not a single individual who could speak or read Portuguese. Some of the men, as has been mentioned, used a form of pidgin Portuguese as a means of communicating with their white neighbors.

648 The attitude of the Nambicuara toward the white man is not only one of suspicion and sullen resentment, but one of disdain. They call white people "civilisados" or sometimes "bean eaters." A Nambicuara feels insulted if these terms are applied to himself. He openly boasts of being a "bugre," a slang term widely applied to Indians in Brazil which signifies a sodomite or heathen. While all other Indians that I have met in Mato Grosso objected to this term when it was applied to them, the Nambicuara always use it when talking about themselves. Julio informed me that the Nambicuara always get sick when they visit white people. The missionaries confirmed this fact but added that the Nambicuara have now become

648 dependent upon the whites for metal tools, guns and ammunition, and feel it necessary to visit white settlements. The Nambicuara are not above visiting white men for treatment of injuries and cases of severe illness.

619 The interband relationships of the Eastern Nambicuara, although characterized by tensions and periodic open conflicts, are based on a recognition of common origin, common speech, and a degree of intercourse through trade, marriage, and the performance of dances in common. The relations with the so-called wild tribes to the north, on the other hand, are based on war, not just on raiding for loot and women, but on a war of extermination. Although the bands south of the telegraph line no longer participate in war, the bands north of the line still fight on occasion with their enemies which they call the Salâunsu and which the whites call the Beiço de Pau.

721

726 When preparing for a war the chief of the band takes the men into the woods and tells them that there are bad people to the north which they must kill. Then after singing a war song they set about making many arrows and war clubs. The night before the attack they camp near the village of the enemy. The men paint their bodies with the sap of some latex tree and their faces with urucú and charcoal. They then take leaves and stuff them into any hole in the ground or in trees around their camp. After all the holes are stopped up, they take the skin of an anteater, the skin of a toad, and the leaves of a tree, which are used in preventing rain, and burn them. The stopping of the holes is believed to prevent the enemy from hearing them, the smoke is to blind the enemy's *owtasu* and, also, to make the enemy sleep soundly. The chief remains at this spot and sings all night with the shamans. At dawn the young men approach the huts of the enemy, stand in the doorways and shout, and when the occupants awaken they are shot down or clubbed. No one is spared. They then take whatever they can, burn the houses, and return to the chief and his singing shamans where the loot is distributed among the warriors.

621 The internal organization of the band is based upon kinship and is perpetuated through cross-cousin marriage. One belongs to the band of his or her mother. Julio explained that when the daughter of the wife whom he abducted from the Elótasu reaches puberty she will return to the

[p. 98(B)]

that their southern neighbors make particularly nice necklaces. Also the meeting of the two groups, when it can take place in a peaceful manner, has as a consequence a series of reciprocal presents. The always impending conflict gives way to a market. This has some very remarkable characteristics in the sense that if one regards the presents only as presents, they do not bring any thanks nor proof of satisfaction. And if one considers them exchanges, they are effected without any bargaining, attempts to set the value of the article, depreciation, or manifestation of disagreement between the parties. Truthfully, they take pains not to admit that there are exchanges going on. Each goes about his usual occupations, and the objects or products go from one to the other, without the one who gives making note of the gesture by which he hands over his present, and without the one who receives paying any attention to his new wealth. In this way are exchanged husked cotton and balls of thread; blocks of wax or resin; urucu paste; shells, earrings, bracelets and necklaces; tobacco and seeds; feathers and sticks of bamboo destined for making arrow points; skeins of palm fibers, porcupine quills; whole pots or broken pottery; gourds. This mysterious circulation of merchandise goes on without haste for a half day or a whole day, after which the groups separate, and each one takes inventory of what he has received, and remembers what he has given. Thus, as regards the equity of the transactions, the Nambikwara trust entirely, the generosity of the partner. The idea that one might estimate, discuss or bargain, demand or take back is entirely foreign to them. We had promised an Indian a hunting sword as the price of transporting a message to a neighboring group. The commission was done, but upon the return of the messenger we had neglected, occupied by other cares, to give him immediately the agreed upon recompense, thinking that he himself would come to get it. He did nothing, and the next day we could not find him. He had left, very irritated his companions told us, and we did not [94] see him again. We were forced to entrust the present to another Indian. Under these conditions, it is not surprising that when the exchanges are finished, one of the groups departs discontented with its lot and, while taking inventory of its acquisitions and recalling its own presents, accumulates bitterness for weeks or months, which become greater and greater and more aggressive.

It seems that wars very often have no other origin. Naturally other causes exist, such as a murder or carrying off women, depending on whether one desires to take the initiative, or whether one wishes to avenge a preceding attack; but it does not seem that a band feels

collectively obliged to make reprisals for an injury done one of its members. Much more often, given the very lively and permanent animosity which reigns between the groups, these pretexts good for exciting the spirit are voluntarily entertained, especially if they feel strong either because of the importance of the group's strength or because of an alliance with neighboring bands against a common enemy, concluded by the intermediary of messengers acting as ambassadors. The proposition of war is presented by an exalted individual or one who exposes before his companions his particular griefs, in the same tone and style that speeches were made at the encounter.

39. ẽ̃ akinãẽ̃ ẑednãẽ̃ ỹõdegãẽ̃ kakonʔẽ̃ ordnʔẽ̃ ỹalaurîẽnʔẽ̃ (b1) whose approximate sense is: "Hello! Come here! Let's go! I am irritated! very irritated! arrows! big arrows!" The Indians become so excited upon the occasion of these epic speeches that it is not possible to obtain the commentary of the formula except well after they have been cited and undoubtedly very unfaithfully. But war is not a matter of purely profane decision. It necessitates a preliminary ceremony which will determine if the signs are favorable or not. Dressed in special attire, tufts of buriti straw dappled with red, hoods of jaguar skin, the men assemble under the leadership of the chief and execute the special dance and chant of war. (1) A divining rite

1. Dances and music will be the object of a special publication.

is then performed. The chief, or the sorcerer in the groups where he exists, goes solemnly to hide an arrow in a corner of the bush. The arrow is retrieved the next day. If it is covered with blood, the expedition is undertaken, if not, it is given up. (2) Many warlike

2. This symbolic use of an arrow seems typical of cultures situated north of the Amazon. The fact is interesting, given the northern affinities of the Nambikwara language. Concerning the use of the arrow as the message of war, cf. Roth, "An inquiry," etc., Annual report of the Bureau of American Ethnology, 30, p. 362; Koch-Grünberg, Zwei Jahre unter den Indianern, etc., Berlin, 1910, Vol. II, p. 316; Gumilla, Historia Natural del Rio Orinoco, Barcelona, 1791, Vol. I, p. 134.

expeditions thus begun end after several kilometers of marching.

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

tainship is not hereditary; the chief, when old or sick, designates his successor from the ablest men of the group. The chief's authority is slight; it depends wholly on the good will of the family heads.

Relations between neighboring bands are inspired both by fear and by the desire to exchange goods. Warfare, therefore, is closely connected with barter. Groups not acquainted with each other use ritual speech when they meet.

Before starting a war expedition, a divinatory rite is performed with special songs and dances. An arrow is hidden by the shaman, the outcome of the expedition being pressaged by its appearance the following day.

LIFE CYCLE

Childbirth.—After the delivery of a child, the placenta is buried in the bush and both parents are subjected to rigid prohibitions concerning food, the use of ornaments, and social contacts.

Puberty.—The initiation rite for young men consists of piercing their lips and nose and giving them their adult personal name. At her first menstruation, a girl is isolated for several months in a special shelter outside the village, where she is given ritual food by her mother. At the end of the rite, she takes a long bath in the river; this also constitutes the first step of the marriage ceremony.

Both cross-cousin and avuncular marriages (see p. 367), are often planned by parents for their infant children. Marriage is celebrated by festivals, banquets, and dances. The union is pronounced by the chief. Fish and fishing are important both before and during the ceremony.

Separation is frequent, the chief cause being that the man seeks a younger and prettier woman. There is no social sanction of adultery, except that the seducer is advised by his companion to go away for a while so as to avoid the husband's revenge. A murderer also flees vengeance.

Death.—Some groups of *Nambicuara* bury their dead in a circular pit, the corpse being placed in a crouching position. Others leave the corpse to decompose in an elongated ditch and later wash the bones in the river, put them in a basket, and bury them in the village, which is then abandoned. Weapons, implements, adornments, and other property of the deceased are destroyed, but his garden—if he owned one—is abandoned only for a few months. Later anybody may cultivate it.

ESTHETIC AND RECREATIONAL ACTIVITIES

Art.—Most *Nambicuara* groups are completely ignorant of drawing, although some groups decorate calabashes with dots and straight and sinuous lines. These are conventionalized reproductions of realistic designs found among other groups.

842 dialect, it is: "to copulate," iruja, juũreli, while "father" is uãinko;
833 but one refers rather to sexual relations by the term ŝikiŝikiŝi, whose
197 evocative value is reinforced by an appropriate gesticulation. This term corresponds, in the other dialects, to the compounds ũinikuŝiŝu (a1), iekejakãtige (b1), "to copulate with rhythmic movements." Likewise, in the western dialect, "to copulate" is expressed by ãinĵore, even though the demonstration evoked at the beginning of this paragraph uses the term ninĩ̃ore.

842 We have not been able to elucidate clearly the indigenous theory of conception (conceive: ũetnẽ̃dige, b1; from ũette, "child"). It implies apparently that the sperm coagulates in the uterus and progressively forms the child. The man alone would play a positive role while the woman would be reduced to that of a simple receptacle. Nevertheless, the woman is held responsible for sterility, whether it be attributed to a particular condition or to age.

834 It is difficult to say if the numerous prohibitions attached to
842 sexual relations have as a conscious end to assure conditions favorable to reproduction, or if they depend on more remote beliefs. The first hypothesis is hardly credible, for the Nambikwara are not very eager to have children. The quest for food is too hard, too difficult, to permit the care of several children at the same time, especially when they are still incapable of taking care of themselves; and especially, during the nomadic period a woman cannot carry more than one nursing child, besides the heavy basket. Thus the first steps of the child are impatiently awaited. At any rate, several prohibitions have, as a definite goal, the limitation of sexual activity. Besides the prohibition of incest (1), it is not good to copulate "moonlit

835 1. The prohibition concerning incest is formulated as follows:

(7) tyaãde takenaãde tamĩ̃ndige manhatte (b1)
for a sister and brother to copulate is bad

●[684] but it does not seem that the infractions are punished other than by collective disapproval. A very equivocal attitude concerning a couple (A71 and a72) and the use, in their regard, of kinship terms communicated with repugnance, and manifestly contradictory to the system, makes one believe that it could be a case of parallel cousins. We have not been able to find a sure case of incest between blood relatives.

836 who seem to be susceptible to violent passions. We knew an Indian who fled with a Paressi Indian girl during our stay, and lived with her for several months hidden in the bush and fleeing the husband who was in hot pursuit after them. Here is the way an informant (B15) tells of a former adventure. He reconstructs a dialogue with the beloved woman:

51. aindarinjẽ — otendnjẽ — ajdoteha ajdakanjajni jutnadajẽ ajrhajtasiindige tamintednjẽ (b1)
Do you want to make love? --I do not wish to. --You are worth nothing! I want to make love or I will kill you! Let us go make love.

Very anxiously the woman responds:

higekanhiẽ jairirẽ jairidednjẽ etjẽdahẽ dungrajeni (b1)
Do it quickly, my husband will be angry, he will beat me.

●684 626 There is no social sanction against adultery; but the wronged husband can avenge himself in a fearful manner and in circumstances of this type poison, used either against the wife or against the lover, plays its role. In order to avoid such incidents, the companions intervene between the adversaries and counsel the seducer to disappear for a while:

52. ijehetnjẽ ajkuakatednjãni ekuude ekuude ekuude ekuude ekuudẽ ekuude ekuude ekuude kajãdodni uãknoreniani (b1)
Go away. --I am going far away. --When this moon is ended and that one, and that one, and that one, and that one, and that one, and that one, and that one, then, in that one, you may return.

We knew an Indian (C11) whose wife disappeared one day, having left with a member of his group. He thought first of revenge, but his companions intervened, and it was finally decided that the lover should keep the wife and would give him a dog as compensation. Several months later, the lover died (we were not able to find out whether the death was normal or accidental), and the woman returned to her husband, who said he was very happy to have acquired the dog [562] also. This story should not be interpreted in the sense of an equivalence, conceived by the Indian spirit, between a woman and a dog. We have insisted too much on the fundamental role of the woman in Nambikwara [182] life to have to return to that here. But in groups where trade [112] exists in such a primitive form (1) exchanges of goods have as a

1. Cf. p. 93 f.

conscious function the bringing of psychological compensations incommensurable among themselves, rather than for establishing equivalences of value.

The Nambikwara have two types of burial. The eastern groups practice double interment. The bodies are first placed in a crouching position (ãriuaerekititu, a1) in a circular ditch (sinitãkurisu, a1) seven feet deep heaped up with earth and branches. For two months, they sing, dance and weep around this provisional tomb, until the body is decomposed. Then the bones are carried to the river where they are carefully washed. Then they are carried in a cloth to be permanently buried in the village. The village is then abandoned, but the site is often visited:

53. auregande aŝunikere kadukarage iaudrige ende ende ende inare inaretaire ŝinoribate (b1)
to dig the grave, to close it, to wait one moon, one moon, one moon, to take out the bones, to bury them in the village.

In the central groups, on the other hand, the bodies would be buried (aoẑenĩkere, b1) in a prone position (iõtarige, b1).

The funeral rites distinguish between movable goods and immovable goods. The first are carefully destroyed; they break and burn the weapons; they unravel the beads and necklaces.

The garden of the dead man, if he cultivated one, is, however, only abandoned, and can be reclaimed later:

54. doôore dũrige adrede autadãtige audotahãmdige audotaãmde odenehẽre odunhĩnde niaõtumnie narainidãnde naraidũrige aĩredugeiõttige den den den nagiaõde aire dugiotige tiatugiõtige (b1)
The arrows are broken, everything must be broken the beads are unstrung, the beads of the deceased, the fields of the deceased are abandoned one moon, one moon, one moon, and when all is forgotten, another takes the field.

Yet it is necessary to avoid confusion on this point. Strictly speaking, there is no land property among the Nambikwara. The chief invites his men to group together to cultivate the gardens, but sometimes such and such an individual decides to clear a field on his own account. These personal appropriations do not give rise to any incidents since the cultivatable land is usually far larger than the collective needs. However, a garden represents a value, because of the considerable amount of work spent in clearing it, especially for people who have never seen metal tools until 30 years ago. Also the rule of destruction of the goods of the deceased respects the

SP17 Nambicuara SP17

tainship is not hereditary; the chief, when old or sick, designates his successor from the ablest men of the group. The chief's authority is slight; it depends wholly on the good will of the family heads. 622

Relations between neighboring bands are inspired both by fear and by the desire to exchange goods. Warfare, therefore, is closely connected with barter. Groups not acquainted with each other use ritual speech when they meet. 619 438

Before starting a war expedition, a divinatory rite is performed with special songs and dances. An arrow is hidden by the shaman, the outcome of the expedition being pressaged by its appearance the following day. 721 787

LIFE CYCLE

Childbirth.—After the delivery of a child, the placenta is buried in the bush and both parents are subjected to rigid prohibitions concerning food, the use of ornaments, and social contacts. 844

Puberty.—The initiation rite for young men consists of piercing their lips and nose and giving them their adult personal name. At her first menstruation, a girl is isolated for several months in a special shelter outside the village, where she is given ritual food by her mother. At the end of the rite, she takes a long bath in the river; this also constitutes the first step of the marriage ceremony. 881 [304]

Both cross-cousin and avuncular marriages (see p. 367), are often planned by parents for their infant children. Marriage is celebrated by festivals, banquets, and dances. The union is pronounced by the chief. Fish and fishing are important both before and during the ceremony. 584 585

Separation is frequent, the chief cause being that the man seeks a younger and prettier woman. There is no social sanction of adultery, except that the seducer is advised by his companion to go away for a while so as to avoid the husband's revenge. A murderer also flees vengeance. 586 684 682

Death.—Some groups of *Nambicuara* bury their dead in a circular pit, the corpse being placed in a crouching position. Others leave the corpse to decompose in an elongated ditch and later wash the bones in the river, put them in a basket, and bury them in the village, which is then abandoned. Weapons, implements, adornments, and other property of the deceased are destroyed, but his garden—if he owned one—is abandoned only for a few months. Later anybody may cultivate it. 764

ESTHETIC AND RECREATIONAL ACTIVITIES

Art.—Most *Nambicuara* groups are completely ignorant of drawing, although some groups decorate calabashes with dots and straight and sinuous lines. These are conventionalized reproductions of realistic designs found among other groups. 531

796

alãgena haɨtige (b1)
to sing in the place.

534 A very strict taboo rests on the flageolets. Only the adult
784 men can play them:

46. ũĩnore ũĩnia imaɨgare.
Children do not know how to play the flageolet.

And the sight of the instruments is rigorously forbidden the women:

denaɨtie iatiaeninĩnena ednaɨo iãneni (b1)
the women cannot see them, only the men see.

These flageolets are made in great secrecy, in the same place where they find suitable bamboo. If the musical expedition returns by day, they hide the flageolets in the branches of a tree not far from the camp or from the village. They only bring them out at night, at the moment of the concert, and the women must then retire to the huts or under the shelters, and hide their heads in
[688] their arms. If one of them violates the taboo, they claim she would be pursued by all the men and killed by blows of a stick. We did not have the chance to attend one of these festivals, but, as we desired to collect the musical repertory of the flageolets, we were able, with a certain amount of difficulty, to arrange it so that a mission was sent to find bamboo and make instruments for us (it was necessary to go about 15 kilometers). Having left in the morning, the group returned in the middle of the night, and until daylight we made music some distance from the camp in order to avoid all feminine indis-
[534] cretion. As each instrument sounds a little different from the others, the playing produces an illusion of harmony which is added to the charm of the melody, in itself very real.

534 It is possible that all the musical instruments of the Nambikwara
789 are connected to activities of an economic-social character. Some testimonials, a decisive confirmation of which I was not able to obtain, present the nasal flutes (araɨtasu, a2) as meant to assure a rich harvest of the fruit piquy. The season of piquy, which grows in
[222] abundance in the plains, is actually an impatiently awaited period for the Indians. The fruit is admiringly weighed and said to have "lots of fat." Likewise the flutes of Pan (asinzu, a1; juauzere, b1) would be employed in the rites preceding hunting expeditions. In
[192] the case of nasal flutes, a double analogy has been pointed out by certain informants between their form and that [106] of the pit of the piquy, and between their name and the name of the piquy (ahaɨru, a 1/2). The latter analogy exists only in the eastern dialect

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

particular form of their own. Death is identified with these spirits. Men's souls are believed to be reincarnated as jaguars, whereas women's and children's souls are taken away by wind and thunder, never to return.

The highest being is the Thunder, with which any man, though usually a shaman, may have personal contact through revelations and visions. Women, however, except when very old, and children are deprived of these privileges. Women are also forbidden, under pain of death, to see the sacred flageolets (see Musical Instruments, p. 368) played at the ceremonies marking the beginning and the end of the dry season.

SHAMANISM AND MEDICINE

The shaman is sometimes distinct from—but more frequently identified with—the political chief. He is distinguished by having the privilege of polygyny, playing the leading role in ceremonial life, and possessing special supernatural powers. He treats patients by sucking out the disease or by fighting it with small ritual arrows called "thunder-arrows."

In addition to magical cures, the *Nambicuara* treat sickness with numerous medicinal plants, which are used externally or internally according to the disease. For eye infection, which is very frequent, they apply the infusion of a special bark with the help of a container made of leaves.

FOLKLORE, LORE, AND LEARNING

The only legend recorded by Lévi-Strauss (n.d. b) is a flood tale relating the destruction of human life and its re-creation through several incestuous marriages between the offspring of an old woman, who was the only being who escaped the disaster.

The only basic numbers used for counting are one and two, but the natives can reckon higher figures by combining these.

Colors are classified differently according to the dialects. The *Eastern, Central, Southern,* and *Western Nambicuara* agree in putting yellow and green in the same category, whereas the *Northern* group identify red and yellow, and class green, blue, and black together.

Some *Nambicuara* groups call stars by the same name which designates the spirits. The year is divided into two seasons and an undetermined number of lunar months. The day includes six main stages, each based on the position of the sun. Space is divided into two sections that are perpendicular to each other, one corresponding to the apparent movement of the sun and the other to the direction of the main waterways.

3&1 The circular spot formed by the village grounds in the middle of the bush gradually acquires the appearance of a star, owing to the paths that lead out from its circumference.

[712 +13] Access to the village grounds is free. There is no fence or hedge to prevent admittance to the plaza; no fortifications or other defensive features are to be found in the vicinity. (1)

> 1. The Tupian Indians of the Gi-Paraná, on the other hand (like the Tupinamba of old and other [tribes]), obstructed the paths leading to their villages with spikes [estrepes] which had to be removed when they established relations with the Rondon Mission. (See Col. M. Rondon, Conferencias [Lectures], pp. 161-162.)

Nambicuara villages always consist of two houses, which are set face to face at opposite ends of the plaza.

[37] [220] The region consists of extensive forests, stretches of scrubland [cerrado], areas of nearly impenetrable bush [charravascal], and a few stretches of open prairie. The Indians prefer the scrubland as the site of their villages.

The forest is dangerous on account of snakes, wild beasts, and even timber which often crashes down on the hunters; the prairie is dangerous because it exposes the village to enemy attack and does not afford any protection against invaders. But the scrubland serves the purpose very well; it has few disadvantages and many advantages.

3#2 This the Nambicuara know well: their hut blends into the greyish hues of the surrounding vegetation; it is like a shrub among other shrubs; from a distance it can hardly be distinguished. Its shape, though well defined, merges into the vague forms of the bush.

Naturally, those whose eyes are accustomed to the dust-veiled mass of xerophytic upland vegetation can quickly spot the huts; the illusion cannot deceive an experienced eye. But the mimicry is nevertheless real.

THEORY OF DEATH

761 775 [100] Death distinguishes between men on one hand, women and children on the other. When they die, the former are transformed into jaguars who represent, consequently, so many reincarnated humans. The women and children, on the other hand, disappear with the wind and the storm and are not susceptible to any reappearance.

40. denõ dũrige uetnatũrina ẽdnadure lukuĩndige ndakuĩndige monãnkiadukuĩndige denõ dũrige monãure lĩttige amonotlĩttige toyodũrige uitendige (b1)
The woman and child who die do not change into beasts. The man who dies is changed into a jaguar, the woman who dies goes away with the tempest disappears with the storm.

262 Whence, among the Nambikwara, the only perfectly clear prohibition concerning food. Theoretically several exist, broken each time that the occasion is presented, such as those concerning the hawk, the worms from the bacaiuva nuts, and there may be added a probable repugnance concerning the meat of the veado (Cervus sp.). Chickens and dogs are never eaten, but their introduction is recent. [224 281 714] On the other hand, the jaguar can be hunted and killed, and its remains are highly regarded since the hide is used to make the fur bonnets worn in the attire of war; but it is not eaten under any pretext:

41. [following preceding text] loukuĩndige inkõra uĩrige lotõtõrige ikuitãdige uĩrige (b1)
775 [the dead man] becomes a jaguar, another eats him, the jaguar carries him off, he is left to another in order to eat him.

This theory complements the information collected in the eastern group more than it differs from it. The jaguar in fact plays the same role as the atãsu, it also carries off the dying. But the central theory adds a complement. This is that the deceased is identified with the animal, who thus becomes a supernatural being. It was not possible to find out if the atãsu which one meets at night are considered to be the souls of reincarnated dead people. (1)

776 171 1. One recognizes in the man-eating jaguar gifted with a supernatural nature a typically Tupi theme, although its present diffusion is much greater. See concerning this subject, Métraux, loc. cit., passim.

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

342 [361] shelter and lights its own fire in the opening. During the rainy season, villages consisting of one or more beehive huts are built on slight hillocks above the course of a secondary stream. Some of the *Eastern Nambicuara* build only shelters, although larger and stronger than the ones described. The beehive hut is very light, each about 10 to 20 feet (3 to 6 m.) in diameter. The frame consists of several long, supple poles, bent so that both ends can be stuck into the ground and tied together at the top, where they cross. Circular branches running horizontally are tied to the poles at different levels. The *Central* and *Western Nambicuara* have a more elaborate hut (pl. 37, *top*) whose perimeter is about 50 feet (15 m.). It has a central post from the base of which several forked poles run obliquely to support the bent poles of the external frame. All types of huts are thatched with horizontal layers of palm leaves, those of *Central* and *Western Nambicuara* exactly like the houses of their southern neighbors, the *Kepikiriwat*.

A gabled house without walls was also observed by Roquette-Pinto, who recorded other kinds of temporary huts. Some were built by sticking two branches into the ground, bending them over and attaching them to a horizontal pole tied to two perpendicular posts and covering them with bunches of grass.

352 513 The *Nambicuara*, although all their neighbors use hammocks, sleep on bare ground or on flat pieces of bark from the paxiuba palm. Because of this custom, the *Paressí* nicknamed them *Uaikoakôre*, "Those Who Sleep on the Ground."

CLOTHING AND ADORNMENT

[291] 301 Both sexes are naked, except that men sometimes tie a small tuft of buruty straw to their belt to cover the sex organs. Both men and women wear a thin, cotton-thread belt strung with white or black beads cut from river mollusk shells or from tucumã palm nuts. Such beads, with larger triangular pieces of mollusk shells, are also used for necklaces, earrings, bracelets, and other ornaments. Men wear grass or reed pins through their upper and lower lips; and, through their nasal septum, a larger pin made of a jacu (*Penelope*) feather mounted on a stalk covered with plaited cotton thread and porcupine quills and trimmed with a red toucan feather ring. Both sexes wear armlets and anklets of woven cotton, burity straw, feathers, parts of dried birds, fur, or mollusk or crawfish shells. Women wear one or more bracelets cut from the tail of the great armadillo and double bandoleers of plaited cotton dyed with urucú and decorated with porcupine quills. Hair ornaments are confined to men: circlets of plaited straw, of straw and and toucan feathers, or of fur with feather pendants. War dress consists of a jaguar-skin bonnet (pl. 36, *top, left*) with a long, plaited buriti-straw tail painted with red stripes and dots hanging down from the nape of the neck. [714]

that their southern neighbors make particularly nice necklaces. Also the meeting of the two groups, when it can take place in a peaceful manner, has as a consequence a series of reciprocal presents. The always impending conflict gives way to a market. This has some very remarkable characteristics in the sense that if one regards the presents only as presents, they do not bring any thanks nor proof of satisfaction. And if one considers them exchanges, they are effected without any bargaining, attempts to set the value of the article, depreciation, or manifestation of disagreement between the parties. Truthfully, they take pains not to admit that there are exchanges going on. Each goes about his usual occupations, and the objects or products go from one to the other, without the one who gives making note of the gesture by which he hands over his present, and without the one who receives paying any attention to his new wealth. In this way are exchanged husked cotton and balls of thread; blocks of wax or resin; urucu paste; shells, earrings, bracelets and necklaces; tobacco and seeds; feathers and sticks of bamboo destined for making arrow points; skeins of palm fibers, porcupine quills; whole pots or broken pottery; gourds. This mysterious circulation of merchandise goes on without haste for a half day or a whole day, after which the groups separate, and each one takes inventory of what he has received, and remembers what he has given. Thus, as regards the equity of the transactions, the Nambikwara trust entirely, the generosity of the partner. The idea that one might estimate, discuss or bargain, demand or take back is entirely foreign to them. We had promised an Indian a hunting sword as the price of transporting a message to a neighboring group. The commission was done, but upon the return of the messenger we had neglected, occupied by other cares, to give him immediately the agreed upon recompense, thinking that he himself would come to get it. He did nothing, and the next day we could not find him. He had left, very irritated his companions told us, and we did not [94] see him again. We were forced to entrust the present to another Indian. Under these conditions, it is not surprising that when the exchanges are finished, one of the groups departs discontented with its lot and, while taking inventory of its acquisitions and recalling its own presents, accumulates bitterness for weeks or months, which become greater and greater and more aggressive.

It seems that wars very often have no other origin. Naturally other causes exist, such as a murder or carrying off women, depending on whether one desires to take the initiative, or whether one wishes to avenge a preceding attack; but it does not seem that a band feels

collectively obliged to make reprisals for an injury done one of its members. Much more often, given the very lively and permanent animosity which reigns between the groups, these pretexts good for exciting the spirit are voluntarily entertained, especially if they feel strong either because of the importance of the group's strength or because of an alliance with neighboring bands against a common enemy, concluded by the intermediary of messengers acting as ambassadors. The proposition of war is presented by an exalted individual or one who exposes before his companions his particular griefs, in the same tone and style that speeches were made at the encounter.

39. ẽ akinãẽ ẑednãẽ ũodegãẽ kakonʔẽ ordnʔẽ ualaurîẑenʔẽ.(b1) whose approximate sense is: "Hello! Come here! Let's go! I am irritated! very irritated! arrows! big arrows!" The Indians become so excited upon the occasion of these epic speeches that it is not possible to obtain the commentary of the formula except well after they have been cited and undoubtedly very unfaithfully. But war is not a matter of purely profane decision. It necessitates a preliminary ceremony which will determine if the signs are favorable or not. Dressed in special attire, tufts of buriti straw dappled with red, hoods of jaguar skin, the men assemble under the leadership of the chief and execute the special dance and chant of war. (1) A divining rite

1. Dances and music will be the object of a special publication.

is then performed. The chief, or the sorcerer in the groups where he exists, goes solemnly to hide an arrow in a corner of the bush. The arrow is retrieved the next day. If it is covered with blood, the expedition is undertaken, if not, it is given up. (2) Many warlike

2. This symbolic use of an arrow seems typical of cultures situated north of the Amazon. The fact is interesting, given the northern affinities of the Nambikwara language. Concerning the use of the arrow as the message of war, cf. Roth, "An inquiry," etc., Annual report of the Bureau of American Ethnology, 30, p. 362; Koch-Grünberg, Zwei Jahre unter den Indianern, etc., Berlin, 1910, Vol. II, p. 316; Gumilla, Historia Natural del Rio Orinoco, Barcelona, 1791, Vol. I, p. 134.

expeditions thus begun end after several kilometers of marching.

721 Excitement and enthusiasm decline, and the group returns home. But some are pushed until realized, [95] and can be very murderous.
726 The Nambikwara usually attack at dawn and extend their ambush by dispersing throughout the bush. The signal for attack is given from
[534 203] place to place, thanks to the whistle which the Indians carry hanging from their necks. This little whistle, composed of two bamboo tubes
[136] tied with cotton thread reproduces the cry of the cricket approximately, and doubtless for that reason has the same name (kalõde) as this insect.

MAGIC, RITES AND RELIGIOUS BELIEFS

278 Some beliefs of a magical and religious character also play
[771] their role in social life. The most important is the notion of nande (b1). To analyze it, we should first say a few words concerning poisons. The Nambikwara are very expert poisoners. They make curare for their arrows, or at least for some of them, pre-
[415] served in little earthen pots. (1) Without enlarging here upon the

1. The study of the Nambikwara curare was made, on the occasion of our expedition, by our friend and companion Dr. J. A. Vellard. Cf. Vellard, "A preparacão do curare pelos Nambikwaras," Revista do Archivo Municipal de São Paulo, LIX, 1939, p. 5-16; "Communication à l'Académie de Médicine de Paris," id. LVIII, 1931, p. 117-118.

manufacture of the curare, it must be noted that this preparation, although reserved for chiefs and sorcerers, is not surrounded by any ritual and does not give rise to any magical operation. The Indians make the curare publicly, applying recipes and taking precautions which are either essential to the effectiveness of the product or which constitute simple prejudices, but all of which have a positive character. Their attitude towards this poison thus may be considered as scientific. Along with curare, the Nambikwara know other poisons likewise of vegetable origin, and which take the form of powders
[415] contained in small tubes. These are made of quills, feathers, or stalks of bamboo or other wood, cleaned out and corked at both ends with a piece of vegetable pith or cotton, and at times decorated with red dots and lines made with urucu paste. (2) These tubes are

2. Cf. Rondonia. Roquette Pinto collected examples of these tubes and reproduced one of them (Rondonia,

tainship is not hereditary; the chief, when old or sick, designates his successor from the ablest men of the group. The chief's authority is slight; it depends wholly on the good will of the family heads.

Relations between neighboring bands are inspired both by fear and by the desire to exchange goods. Warfare, therefore, is closely connected with barter. Groups not acquainted with each other use ritual speech when they meet.

Before starting a war expedition, a divinatory rite is performed with special songs and dances. An arrow is hidden by the shaman, the outcome of the expedition being pressaged by its appearance the following day.

LIFE CYCLE

Childbirth.—After the delivery of a child, the placenta is buried in the bush and both parents are subjected to rigid prohibitions concerning food, the use of ornaments, and social contacts.

Puberty.—The initiation rite for young men consists of piercing their lips and nose and giving them their adult personal name. At her first menstruation, a girl is isolated for several months in a special shelter outside the village, where she is given ritual food by her mother. At the end of the rite, she takes a long bath in the river; this also constitutes the first step of the marriage ceremony.

Both cross-cousin and avuncular marriages (see p. 367), are often planned by parents for their infant children. Marriage is celebrated by festivals, banquets, and dances. The union is pronounced by the chief. Fish and fishing are important both before and during the ceremony.

Separation is frequent, the chief cause being that the man seeks a younger and prettier woman. There is no social sanction of adultery, except that the seducer is advised by his companion to go away for a while so as to avoid the husband's revenge. A murderer also flees vengeance.

Death.—Some groups of *Nambicuara* bury their dead in a circular pit, the corpse being placed in a crouching position. Others leave the corpse to decompose in an elongated ditch and later wash the bones in the river, put them in a basket, and bury them in the village, which is then abandoned. Weapons, implements, adornments, and other property of the deceased are destroyed, but his garden—if he owned one—is abandoned only for a few months. Later anybody may cultivate it.

ESTHETIC AND RECREATIONAL ACTIVITIES

Art.—Most *Nambicuara* groups are completely ignorant of drawing, although some groups decorate calabashes with dots and straight and sinuous lines. These are conventionalized reproductions of realistic designs found among other groups.

648 dependent upon the whites for metal tools, guns and ammunition, and feel it necessary to visit white settlements. The Nambicuara are not above visiting white men for treatment of injuries and cases of severe illness.

619 The interband relationships of the Eastern Nambicuara, although characterized by tensions and periodic open conflicts, are based on a recognition of common origin, common speech, and a degree of intercourse through trade, marriage, and the performance of dances in common. The relations with the so-called wild tribes to the north, on 721 the other hand, are based on war, not just on raiding for loot and women, but on a war of extermination. Although the bands south of the telegraph line no longer participate in war, the bands north of the line still fight on occasion with their enemies which they call the Saláunsu and which the whites call the Beiço de Pau.

726 When preparing for a war the chief of the band takes the men into the woods and tells them that there are bad people to the north which they must kill. Then after singing a war song they set about making many arrows and war clubs. The night before the attack they camp near the village of the enemy. The men paint their bodies with the sap of some latex tree and their faces with urucú and charcoal. They then take leaves and stuff them into any holes in the ground or in trees around their camp. After all the holes are stopped up, they take the skin of an anteater, the skin of a toad, and the leaves of a tree, which are used in preventing rain, and burn them. The stopping of the holes is believed to prevent the enemy from hearing them, the smoke is to blind the enemy's *anúnsu* and, also, to make the enemy sleep soundly. The chief remains at this spot and sings all night with the shamans. At dawn the young men approach the huts of the enemy, stand in the doorways and shout, and when the occupants awaken they are shot down or clubbed. No one is spared. They then take whatever they can, burn the houses, and return to the chief and his singing shamans where the loot is distributed among the warriors.

621 The internal organization of the band is based upon kinship and is perpetuated through cross-cousin marriage. One belongs to the band of his or her mother. Julio explained that when the daughter of the wife whom he abducted from the Elótasu reaches puberty she will return to the

721 Excitement and enthusiasm decline, and the group returns home.
But some are pushed until realized, [95] and can be very murderous.
726 The Nambikwara usually attack at dawn and extend their ambush by
dispersing throughout the bush. The signal for attack is given from
[534 202] place to place, thanks to the whistle which the Indians carry hanging
from their necks. This little whistle, composed of two bamboo tubes
[136] tied with cotton thread reproduces the cry of the cricket approximately,
and doubtless for that reason has the same name (kalõde) as this insect.

MAGIC, RITES AND RELIGIOUS BELIEFS

278 Some beliefs of a magical and religious character also play
[771] their role in social life. The most important is the notion of
nande (bl). To analyze it, we should first say a few words con-
cerning poisons. The Nambikwara are very expert poisoners. They
make curare for their arrows, or at least for some of them, pre-
[415] served in little earthen pots. (1) Without enlarging here upon the

1. The study of the Nambikwara curare was made, on the occasion of our expedition, by our friend and companion Dr. J. A. Vellard. Cf. Vellard, "A preparacão do curare pelos Nambikwaras," Revista do Archivo Municipal de São Paulo, LIX, 1939, p. 5-16; "Communication à l'Académie de Médicine de Paris," id. LVIII, 1931, p. 117-118.

manufacture of the curare, it must be noted that this preparation, although reserved for chiefs and sorcerers, is not surrounded by any ritual and does not give rise to any magical operation. The Indians make the curare publicly, applying recipes and taking precautions which are either essential to the effectiveness of the product or which constitute simple prejudices, but all of which have a positive character. Their attitude towards this poison thus may be considered as scientific. Along with curare, the Nambikwara know other poisons likewise of vegetable origin, and which take the form of powders
[415] contained in small tubes. These are made of quills, feathers, or stalks of bamboo or other wood, cleaned out and corked at both ends with a piece of vegetable pith or cotton, and at times decorated with red dots and lines made with urucu paste. (2) These tubes are

2. Cf. Rondonia. Roquette Pinto collected examples of these tubes and reproduced one of them (Rondonia,

had been poisoned. An attack of reprisal was carefully prepared and took place, in the course of which A1 and A5 distinguished themselves. The six persons composing the mission were killed by beating or pierced with arrows, including a baby of two. Only one woman was found alive by an expedition sent to aid them from Cuiabá. The version which she gave of the events coincides exactly with that which we collected from the main protagonists of the other camp. 177 648 797 [124]

Poison was still to play a role in the life of A6, and this during our stay. We found ourselves visiting (August 1938) at the camp of a neighboring group (a2), and relationships became quickly strained between A6 and our hosts, undoubtedly over the question of women, so that he got the habit of coming to my camp to seek a more friendly atmosphere, at the same time that he shared my food. This fact was noticed, a delegation of four men came to find me one day, and in quite a menacing tone of voice told me to mix some poison (which they brought me along) in the next dish which I would offer to A6; they thought it advisable and indispensable to do away with him at once, for, they told me, he is "very wicked" (kakore) and "is worth nothing" (ajdotiene). I had the greatest difficulty in getting rid of my visitors without opposing them with a refusal which in turn would have exposed me to animosity which I had just learned it was better to avoid, and I considered my best plan of action to exaggerate my ignorance of the language, and to feign obstinate lack of comprehension. After several attempts, my visitors retired very disappointed. I warned A6 who immediately disappeared. I was to see him again only four months later. 278 578

These incidents are characteristic of Nambikwara psychology. The Nambikwara are very open, confident and spontaneous, but they are very sensitive and react with great violence to deception [125] or disappointment. Few primitives are as easily accessible. Few give as free access to their intimate lives, to their beliefs, daily acts, thoughts and sentiments. But despite this facility and cordiality, the visitor, be he an ethnographer or a member of a neighboring tribe—must constantly be on guard and watch his actions; for the slightest imprudence, the least clumsiness, may incite reactions difficult to evaluate among his hosts, and in connection with which recent events are always present to recall that they may be extreme. A6 offered a perfect example of this confidence and spontaneity, allied with brusk manifestations of violence and irritability. 157 648

Thus, the Nambikwara character alternately presents two aspects, or more exactly, testifies to a double nature: one which we shall call positive, and which goes much farther in this sense than among many Indians in contact for centuries with the whites; and the other, of metaphysical nature, whose rigor and exaltation at times evoke the mysticism of the North 157

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

string (secondary release). Four types of arrows are used: (1) featherless fishing arrow with three to five prongs; (2) bird arrow with a blunt point; (3) big-game arrow with a lanceolate bamboo point; and (4) poisoned arrow, used chiefly for hunting monkeys, with several barbs which are attached to the point with cotton wrapping and which break easily in the wound, being, therefore, usually protected by a bamboo sheath. The last three have a bamboo shaft and "Arara" feathering. Sewed feathering is known by the central and northern groups but seldom used. For warfare, big game arrows with serrated bamboo points are used.

Nambicuara arrow poison is a curare prepared by grating the root of a *Strychnos* shrub, and by infusing (*Eastern Nambicuara*) or boiling (*Central* and *Northern Nambicuara*) it until the water evaporates and leaves a thick brownish substance, which is smeared on a wax-coated arrow point. It can be preserved in tiny pots for several months. Among South American arrow poisons, it is remarkable because it is made of only one vegetable substance and is prepared openly—in some groups by the chief or shaman, in other groups by anyone—without magical practices or taboos. Its great toxic properties were studied by Vellard (1939 b).

Other poisons of unknown composition are used for amorous or political revenge. They are in the form of powders and are kept in tubes made of feather quills, bamboo, or other woods, each ornamented with paintings and cotton or bark wrappings.

Clubs are carved in the shape of a flattened or cylindrical pointed spade; the handle is often adorned with black and white plaiting of philodendron bark and bamboo strips. Their purpose is mostly ceremonial.

SOCIAL AND POLITICAL ORGANIZATION

Kinship terms identify parallel-cousins with siblings, and cross-cousins with potential or actual spouses. Cross-uncles and cross-aunts are called by the same terms as parents-in-law and grandparents; parallel-uncles and parallel-aunts are equated with parents. Similarly, parallel-nephews and parallel-nieces are classed with children, and cross-nephews and cross-nieces with children-in-law. Marriage is between cross-cousins or between the maternal uncle and his niece. Monogamy is the rule, but polygyny is the privilege of the chief and other important men. Polygyny is usually with several sisters (sororal) or with a woman and her daughters by a former union. The first wife runs the household, subsequent wives being assistants to the husband. The deficiency of available women which results from polygyny is compensated by homosexuality between adolescent male cross-cousins (Lévi-Strauss, 1943 a).

The village is ruled by a chief, but each of the nomadic bands into which it splits during the dry season is led by a secondary chief. Chief-

648 dependent upon the whites for metal tools, guns and ammunition, and feel it necessary to visit white settlements. The Nambicuara are not above visiting white men for treatment of injuries and cases of severe illness.

619 The interband relationships of the Eastern Nambicuara, although characterized by tensions and periodic open conflicts, are based on a recognition of common origin, common speech, and a degree of intercourse through trade, marriage, and the performance of dances in common. The relations with the so-called wild tribes to the north, on the other hand, are based on war, not just on raiding for loot and women, but on a war of extermination. Although the bands south of the telegraph line no longer participate in war, the bands north of the line still fight on occasion with their enemies which they call the Saláunsu and which the whites call the Beiço de Pau.

721

●726 When preparing for a war the chief of the band takes the men into the woods and tells them that there are bad people to the north which they must kill. Then after singing a war song they set about making many arrows and war clubs. The night before the attack they camp near the village of the enemy. The men paint their bodies with the sap of some latex tree and their faces with urucú and charcoal. They then take leaves and stuff them into any holes in the ground or in trees around their camp. After all the holes are stopped up, they take the skin of an anteater, the skin of a toad, and the leaves of a tree, which are used in preventing rain, and burn them. The stopping of the holes is believed to prevent the enemy from hearing them, the smoke is to blind the enemy's *anúnsu* and, also, to make the enemy sleep soundly. The chief remains at this spot and sings all night with the shamans. At dawn the young men approach the huts of the enemy, stand in the doorways and shout, and when the occupants awaken they are shot down or clubbed. No one is spared. They then take whatever they can, burn the houses, and return to the chief and his singing shamans where the loot is distributed among the warriors.

621 The internal organization of the band is based upon kinship and is perpetuated through cross-cousin marriage. One belongs to the band of his or her mother. Julio explained that when the daughter of the wife whom he abducted from the Elótasu reaches puberty she will return to the

535 Anunze and Uintaçu tribes participated; and a festive dance in which we took part, executed in our honor at Três Buritis by the Tagnani and Tawite.

The war dance filmed in Campos Novos was later also [253] performed by the Tagnani in Três Buritis.

Armed with bows and arrows, the warriors form a line some 15 meters from a piece of wood which represents the enemy, singing in two-part time and marking the beat on the ground with their feet. [Fig. 25]

Two Indians leave the line, arrows ready and bows half strung, and walk as if cautiously hiding among shrubs in the bush. After a wide detour they come near the "enemy" and hurl their weapons at him.

This is the signal to attack; the singing ceases and a rain of arrows falls on the "unfortunate victim"...

41 Then they advance upon him and give him a thorough drubbing
224 with their bows or with sticks. Incidentally, this is always the func-
726 tion of the arrow--to immobilize the enemy or game and permit the attacker to come close and finish his work with blows. In the hunt or in combat, attack is always made from ambush. This is because the aim of the Indians at a distance [Fig. 27] is not as sure as generally supposed. The Nambicuara are not especially good archers. They certainly cannot draw the bow with their feet like the Bororo. Some can shoot well in height. They use no shield whatever either in the hunt or in war. After the attack they try to recover their projectiles. An arrow represents a certain amount of labor and must not be squandered...

They hold a number of arrows in their left hand and shoot them one after the other with incredible rapidity.

535 Men, women and girls participated in the festive dance.

A large circle was formed to the sound of an endless chant. The women stood on the men's left; pair after pair were joined until the circle was closed. [254] Each man placed his hand on the shoulder of the woman next to him. Within the circle, three girls of approximately the same age accompanied them in a close line, eyes lowered, hands crossed upon the chest. The girl in the center acted as a hub for this choreographic formation... [Fig. 43]

/216 cont./

224 The poisoned arrows are intended for hunting certain ani-
278 mals, some large birds, cervids, and especially monkeys.
411 Birds wounded by one of these arrows fall almost immediate-
[303] ly.

A monkey mortally wounded with an ordinary arrow or even a bullet often remains hanging from the branches. Under the action of curare it holds itself immobile at first, then begins to tremble and falls several minutes later (five to 10 at the most) as soon as paralysis is produced.

A peccary or small deer such as the Cervus campestris wounded in the body runs for one or two minutes, then stops exhausted, is attacked by tremors and lies down.

The tapir, very large, resists a long time; it can run for two hours before stopping; hence the Indians do not hunt it with curare.

[262] /217/ The meat of animals killed with curare may be
[252] eaten without harm; the Ñambikwara of the Juruena content themselves with cutting away the flesh around the wound impregnated with poison and colored yellow; the Çabanè do not even take this precaution.

278 Poisoned arrows are also used for war; this is perhaps their
411 principal object among many Ñambikwara groups, who possess
726 only a very few specimens during normal times.

None of the Indians know of an efficacious antidote. According to our informants wounds in the trunk would always be fatal to men. By immediately drawing out the arrow, it might be possible to survive a wound in a limb; in order to make their extraction more difficult, the points of the poisoned arrows, especially those of the Çabanè, are very lightly attached to their shafts.

sionaries had not yet learned enough Iranxe to make working with informants possible.

As all of the following information, unless otherwise specified, relates to the Waklĭtisu band, a short description of this band is in order. Today the band consists of 18 individuals, of which Julio is the chief. About 5 years ago, before a measles epidemic decimated it, the band was roughly twice the size it is today. Julio is a man of middle age, has three wives and two children, and probably holds his leadership by being the strongest and ablest man in the band. Except for one of Julio's wives and her daughter who are Elótasu, the members of the band are Waklĭtisu and related to one another. Julio took the Elótasu woman from the Elótasu band by killing her husband. He claims he did this because the Elótasu chief stole one of his wives some years ago. He claims he is going to steal another wife, for every chief is supposed to have four. Only three other men, Martin, Marciano, and Joaquin, are married, each having one wife. The remaining four are either widowers or as yet unmarried.

Of all the Indians which I have visited in Mato Grosso the members of this band of Nambicuara were the most miserable. Of the eight men, one had syphilis, another had some kind of infection in his side, another had an injured foot, another was covered with some kind of scaly skin disease from head to foot, and another was deaf and dumb. The women and children, however, appeared to be healthy. Owing to the fact that they use no hammocks but sleep on the ground, they are always covered with dirt. On cold nights they remove the fires and sleep in the warm ashes. The Waklĭtisu wear clothes only when they are given by the missionaries, who ask that they be worn. Their distaste for bathing permits not only a covering of dust and ashes to accumulate on their skin and hair but also particles of decayed meat and fish, which, combined with stale sweat, makes proximity to them rather distasteful. They also appear to be heavily infected with internal parasites, for their stomaches are distended and they are continually passing wind. On several occasions when a number of them had crowded into the small room we used for working we had to cease work in order to air the room.

In their manners the Nambicuara also contrast sharply with the other tribes I visited. The

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

sometimes the fathers of several children, walking together at dusk and tenderly embracing each other; always

tarũtę ialásiętę

(these are) brothers-in-law embracing (each other).

Certain games, too, such as the "scratch game" (in which the opponents try to scratch each other especially in the face), are commonly played by brothers-in-law.

But the close relationship between "cross cousins actually or potentially allied through a sister's marriage"—the more accurate translation of the aboriginal term for brother-in-law—may extend far beyond the family tie. Actually, it is sometimes used to establish between individuals not belonging to the same kin group new links of a special nature, the function of which is to amalgamate into a single familial unit several formerly unrelated groups. This is brought out clearly in the following case.

During the past twenty years, several epidemics nearly destroyed the central, northern and western divisions of the Nambikuara. Several groups were decimated to such an extent that they could no longer successfully maintain a socially autonomous existence. In the hope of reconstituting functioning units, some of these, therefore, attempted to join forces, In the course of our field-work we met and worked with such a merged group made up of seventeen individuals using the northern dialect (*Sabãnę* group) and thirty-four using the central dialect (*Tarãndę* group). Each of the originally distinct groups, however, lived under the guidance of its own chief, although both leaders closely cooperated. It is probable that the demographic crisis did not by itself account for this situation, since the people of the second group formed merely a fraction of a more numerous unit from which it had split off for reasons unknown to us. However, from several events which occurred during our stay with them, we deduced that the break had been caused by political dissention, the details of which remained obscure to us. In any event, these groups now travelled and lived together although two separate but contiguous camps were maintained in which the families formed distinct circles, each around its own fire. The most amazing feature of this curious organization was that the two groups did not speak the same language and were able to understand one another only through interpreters; fortunately, one or two individuals belonging to each group had sufficient knowledge of the other dialect to act as intermediaries. Even the two chiefs could not communicate directly. The problem of whether these dialects belong to the same linguistic stock need not be raised here; but the Northern group undoubtedly must be classified with the Nambikuara cultural family because of the similarities of material culture and of the life pattern, and chiefly because of the psychological attitude of the people, who very evidently believed in their close affinity to the Central group.

855 and he is left alone a whole day. When evening comes, however,
157 his mother cares for him tenderly, removes lice from him while he sleeps, signals to others not to approach, and makes for him a sort of cradle in her arms.

854 A young mother, c21, plays with her baby giving him little slaps
157 on the back. The baby begins to laugh, and she gets excited by the game to such an extent that she hits him harder and harder, so that he cries. Then she stops and consoles him.

736 We saw the little orphan girl a9, whom everyone loves, literally trampled during a dance. She had fallen in the general excitement
858 of the celebration without anyone paying any attention. On the other hand, when they are opposed, children readily strike their
865 mother, and the latter does not fight back. Children are never
861 punished, and we have never seen one of them spanked, nor even the
855 gesture made, except as a joke. Sometimes, a child cries (1) because
515

1. The tears of a child are not called by the same name as those shed ritually by adults in the course of mourning. In the first case: to weep, nãsere, nãdige; in the second: to weep, doriãgesere (b1).

he has hurt himself, was in a fight, or is hungry,

10. ũtsotnaniena narũdnerajena indõtenajena ũ?eere (b1) the child cries, he is thirsty, he is hungry, he wishes to eat,

or because he does not want to be deloused. But this last case is rare, for delousing seems to charm the patient as much as it amuses the operator. It is also held to be a mark of interest and affection. When he wishes to be deloused, the child—or the husband—places his head on the woman's knees, presenting the two sides of his head in succession. The operator proceeds by parting hair or looking through the strands. The louse that is caught is immediately crushed. The child who cries is quickly consoled by [68] a member of his family or by an older child. In general, they have little to com-
[861] plain about. Very pampered, rarely scolded, never whipped, they live free, useless and lazy.

854 Also, the sight of the mother and her child is usually full of gaiety and freshness. The mother holds an object out to the baby through the straw of the shelter and withdraws it at the moment the baby thinks he has it:

854 11. kalajodnẽ daẽ joʔdnoherẽ (b1)
Take it from the front! Take it from the back!

Or else, amidst great bursts of laughter, she takes the child and pretends to be going to throw him to the ground:

12. ʔãmdam nõm tebũ nĩhiŋi (b1)
(The mother) "I am going to throw you!" (the child) "I don't want to!"

855 593 Reciprocally, the children surround their mother with a tenderness that is demanding and sometimes unquieting. At the time of leaving group b1, we jokingly proposed to a little girl (b5) that we take her with us. Her response was very characteristic, and at the same time similar to that which many other children would have made under the same circumstances:

13. hõdnẽ odengenãhien ŝuadaʔien tanãhnãdaje. (b1)
No! I don't want to go! I am afraid! Mama would cry!

And another observation also makes evident the affection which is always present on the part of the child: a father (C20) brings wild honey and begins by giving some to his son (C22), and only then to his wife (c21); the child, worried, watches his father's movements to see if his mother will receive her share.

[862] 855 593 During the period which precedes weaning, the child lives in as great intimacy with his father as his mother. Like the latter, the father takes care of him, holds him in his arms, wipes up his excrement when necessary, etc. Later, the child lives closer to his mother. She carries him on trips till he can walk, and later he walks at her side. He remains with her at camp or village while his father goes hunting. However, the proprieties of relationships depend first of all on the sex of the child. A father shows more interest in his son than in his daughter, since he must teach him the masculine techniques and occupations: and the same thing is true concerning relationships of a mother and daughter. But as a whole, the relationships of the father with his children show the same [843] tenderness and solicitude that we have previously mentioned. The father plays with his child while carrying him on his shoulder (alakuiriginare, b1). He makes weapons to fit the size of the child's little arms:

14 mĩʔnde taŋirẽtnore ikʔlaagetire (b1)
The father makes arrows for the child.

736 [69] Concerning a young male orphan, nearly an adolescent, it was said to us one day that "he does not go hunting because he has no father to make him a bow." In certain cases, the father must extend his care and, to a certain degree, substitute for the absent

[734] wife. We have already cited the case of the two little girls
513 a8 and a9 whose stepmother (a7) refuses to take care of them.
Their father (A6) must, then, assume many of the lesser func-
[542] tions. At the time of departure for a trip, it is he who prepares
the basket for the elder, measures on her the length of the tump
line, and shortens it thanks to the free end which he fastens
passing it several times through the holes of the basket-work.
869 It is also the father who tells the children the traditional stories.
538 And, with a view to shortening and making more intelligible
these often long and repetitious accounts, he applies himself
to transposing them in a style especially adapted for children.
Thus, the infant's version of the story of the Flood (1) is as

1. See below, p. 120, the complete version of this story.

follows:

15. ɣáitento dohonenŝiram kánaram hépatnẽ atátene
ɣeidenkjathattene ɣafndɣnle. (b1)
Everyone was dead! There was no one left! Not a man!
Everyone was dead! Nothing more!

515 Relationships of a particular nature exist in the case of
571 polygamous marriage between the children of the first wife and
their young stepmothers. Even though the latter are called
"mother" or of "sister of the mother" by them, they live in a
state of companionship with them, especially with the girls,
which also extends to all the children of the group. We have
already dwelled on this society of girls and young wives who
take collective baths, go to defecate in a group, smoke to-
gether, joke and give themselves over to rather farfetched games,
such as spitting long jets of saliva in one another's face. An-
other example: a3 and a4 play with their stepdaughter a5. One
of them pushes her and throws her to the ground with such
violence that her head cracks against the ground and the little
one begins to shriek. The two young women heap mockeries
upon her. Finally, the youngest goes to drag her from the
ground almost by force and pushes her toward her mother, with-
out ceremony, like a package. These relationships are close,
appreciated, but without courtesy, like those which young boys
might have in our society. They rarely imply service or atten-
tion. Thus, A1 and his polygamous wives a3 and a4 divide a

164 These papery scales cannot be removed easily; I noticed that they did not come off when the woman scratched herself. I believe that the itching is much less severe at this time; it seemed more intense during the initial stages.

I cannot be definite about the time span of the disease. The symptoms evolve in a few days from the first to the second stage, but the latter seems quite prolonged.

[183] Some of the scabs contain incipient papery scales. However, as I had the opportunity to see only one woman and one girl, her daughter, whose bodies were entirely covered with the lesions of the last stage, I believe that the disease does not always reach this point. It may remain stationary at the second stage, or it may recede [involuir].

For the time being, therefore, I ascribe three stages to the disease:

(a) the cyst stage
(b) the scab stage
(c) the scale stage

I believe that these correspond to evolutionary phases of the same disease, and not to different diseases, because I found transitional forms on some of the affected individuals.

Besides, [the Indians] indicated by means of very clear signs that the final symptoms began with the cyst stage, the only one found in nursing children.

[757] The Indians spread saliva on the scabs; we do not know yet [278] whether they use any herb against the disease. They probably do, for veritable herbariums were found in their villages.

302 751 Another question that remains to be solved is the possible effect on the disease of the Indians' custom of painting their body with a greasy paste made from the juice of the urucu seeds. (1)

[113]

1. Alvaro Osorio de Almeida (in the Boletim do Museu Nacional, Vol. 7, 1931, No. 1) studies the reactions of skin painted with urucu to the actinic rays of light and to solar heat. His experiments led him to the following conclusions:

"Once smeared with urucu, the

302
751

Indians are as well protected against the actinic action of the sun as if they were wearing the thick clothing of the Sahara tribes. Because they are nude, however, the air circulates freely around their body, reducing the heat and hastening the evaporation of perspiration.

"If exposed to sunlight, in accordance with the property described above, urucu absorbs only slightly the heat of the sun, reflecting the red rays and also the heat rays. For this reason the white man or one with slight pigmentation, when smeared with urucu, does not perspire excessively as does the Negro under the same circumstances.

"In view of the properties ascribed to urucu by our experiments, and of the widespread usage of this dye among the Indians of tropical America, we believe that it should be considered not as merely ornamental but as an effective means of protection against tropical light and heat."

164 [184] The manifestations and evolution of the disease lead us to believe that it is a dermatomycosis. The habitat of the pathogenic fungus is probably to be found in the soil. This would explain why the personnel of the Line, who have lived among the Nambicuara for years, have not yet contracted the disease. This also applies to the Paresi, [513] who are now in contact with the diseased Indians. Both groups, unlike the Nambicuara, make use of hammocks and never sleep on the ground.

To this day, no microscopic examination of the scales has been made, and I am not responsible for this failure. In 1912 the Indians [123] would not allow us to collect the necessary materials; they were still suspicious.

241 [Plates p. 254]

[249] Yet a wild form of manioc has been found (Manihot utilissimo, Pohl); if not the very species we use, at least one of the same genus. But maize?

Where on the surface of the earth does maize exist in a wild state except for the tunicated Zea mais which is sometimes considered to be the ancestor of the modern species?

What unveiling of mysteries, if this question were to be answered!

Some Tagnani who were watching the herdsman João Lucas weed a small plot in Três Buritis began to laugh at him, indicating that it would be better to root up the weeds; the hoe severed the stems but left in the roots, and the plants would grow up again. When the Nambicuara weed, they pull out everything that is not useful. Their plots are always clean.

Their tobacco is the Nicotiana that grows wild in their mountains; it may not properly be said that urucu and cotton are cultivated: they are planted and utilized. Some large beans of various kinds de-
278 241 serve mention. [250] They are to be found in the Indians' baskets along with many other plants; but we never saw an Indian eating them or making any use of them. Pending further research, I am of the opinion that they are saved for medicinal undertakings carried out in secret by old men and women. The same may be said of the castor oil plant (Ricinus communis), which is definitely adventitious.

[Fig. 39]

415 The spools of cotton fiber that await spinning and the seeds saved for future use are kept out of the weather, dust and rain in bags made of straw or pacova leaves.

[Fig. 40]

759 It seemed to us that medicine was not exercised by any special segment of society. They all take part in the treatment of certain diseases; in serious cases, an experienced elder takes over.

752 Wounds are dressed with straw fibers [coated] with certain resins (jatobá). Burns are treated with cold water. Fractures and dislocations are reduced haphazardly.

752 They spread saliva on bâanêcedútú sores with the palm of the hand. They squeeze insect bites between two fingers.

757 Those suffering from fever go quietly into a corner, when they do not leap into running water. They eat nothing as long as the seizure lasts.

In the village on the Juina River there was an old Indian of about sixty. He was sad and prostrate and was not cheered by our gifts. He would put his hands to his head to show that it was aching. A lad who seemed [251] to be his son judging by the extreme affection he bestowed on the old man, contrary to the other Indians, kept offering him honey with water. Each time the old man would turn away. In the afternoon, his condition not having improved, he called the boy and said something to him.

The lad grasped the man's head in his hands and put his mouth against the nostrils, sucking hard. It seems that this suction which he repeated later was helpful, for the old man became more expansive.

[Fig. 41]

853 Childbirth must be easy, considering how poorly the foetus is nourished. The Indian women, when they do not have sufficient milk, take a drought of water in their mouth and put their lips onto those of the baby, transferring the liquid in a nourishing kiss.

844 I wanted to know how they cut the umbilical cord and showed several Indians who were more outgoing and intelligent--Damasceno, Nuleke, Krikricekmerá--a drawing in a book that showed a foetus with its attachments. From Damasceno's replies I understood that the mother cuts the cord with her teeth and hides the placenta under some leaves.

This piece of information obviously remains subject to revision.

531 Drawings by the Indians of the Serra do Norte, though rudimentary, reveal some interesting motifs emancipated from animal forms.

The circle, triangle and square are drawn in black on the surface of some gourds.

[532] [252] Snakes and saurians are sometimes drawn sketchily(1)

113 1. See E. Roquette-Pinto, "Documentos para o estudo da psicologia dos Indios do

627 The chief admon-
[622] ishes quarrelsome individuals but appears to have no powers of coercion. The Waklĭtisu claim that individuals quarrel but they do not fight among themselves nor do they remember any cases of murder. Unwanted individuals are exiled by common agreement. Houses, fields, and some implements are common property, and food is shared among the members of the band. Axes, machetes, and knives, although owned by individuals are freely used by other members. At death, privately owned tools pass to a man's sons or to his brother. The bow is customarily broken and left on the grave. Even these rules are not strictly adhered to, for when a man becomes seriously ill other men begin to help themselves to his property and the one with the "strongest mouth" gets the most. If the man recovers he cannot reclaim his things but must set about accumulating a new supply.

421 [428] [764]

593 The wife and the children are under the strict control of the husband. Although boys must obey their fathers they owe no special obedience to their mothers. Boys sometimes throw stones and sticks at their mothers and the old women; the older men not only laugh but even encourage this disobedience. The bond between brothers is very close. On occasion they share each other's wives. No particular respect is paid to in-laws.

[837]

RELIGIOUS BELIEFS AND PRACTICES

774 According to the Waklĭtisu the spirits are the source of all danger, misfortune, sickness, and death. The ghosts of the dead (*aydnkadiu*), bring sickness unless offerings of food are made to them. The ghosts of dead shamans (*anúnsu*), belonging to other bands bring thunderstorms which destroy gardens and make hunting difficult. In addition to the ghosts, there is *tauptú*, the hawk of death who lives in the sky, and *ulurú*, the evil armadillo who lives under the ground and wants to destroy the villages and camps of the Nambicuara.

[782] ● 753 [821] 776

Tauptú is an enormous hawk with huge wings, tail, and claws, who sits in a tree made of human bones. This tree (*lúlukatsu*) is situated on the shore of a shallow lake in the sky. Shooting stars are caused by *tauptú* defecating at night. A small red bird (*dinínuwa*), who lives with *tauptú*, urinates into the lake and when it fills up the urine overflows and comes down in the form of rain.

[821]

[p. 99 (B)]

776 [753] *Tauptú* does not cause illness, but when people get sick he begins to eat away the flesh and finally kills them and eventually takes their bones to his abode in the sky. The missionaries told me that when the first airplane appeared in Nambicuara territory the Indians ran into the forest and hid because they believed the airplane was *tauptú*. Shamans sometimes visit the land of *tauptú* by riding up to the sky on the back of [756] *urutai*, the night hawk or goat sucker. Julio claimed that his father-in-law, who was a powerful shaman, had visited the realm of *tauptú* while in a trance.

776 756 The Wakltisu fear most of all the spirit armadillo called *ulurú*. When someone sees bits of manioc cake and charcoal floating on the river near the village, he comes back and tells the shaman, who then goes to examine the signs. If the shaman decides that it is *ulurú*, immediate action must be taken to save the world from destruction. The women and children shut themselves in their huts while the men take their wooden sword clubs (*hulúkisu*) and go to the bank of the river. The shaman then digs a deep hole in the bank, into which he is lowered with a rope. When he has grasped *ulurú* by the tail he signals the men on the surface to pull him out. The shaman remains at the mouth of the hole with his arm thrust in, holding *ulurú* by the tail while with his other hand he marks points on the ground which are directly over the head, heart, and stomach of *ulurú*. One by one the men thrust their sword clubs into the ground at the places marked by the shaman. As they push the blades in they twist them to make sure that they kill *ulurú*. After the spirit armadillo has been killed, the men go back to the village leaving the shaman alone with the dead *ulurú*. The shaman then cuts up the spirit armadillo, washes the pieces in the river, and begins to sing. When the ghosts of the dead Nambicuara hear the song they come and eat the pieces prepared by the shaman, after which they go away happy because the Nambicuara have been saved.

776 [821] The Wakltisu say that if they should ever fail to kill *ulurú*, a terrific storm would appear followed by an earthquake, for when *ulurú* gets under the village he will turn the world upside down, *tauptú* will fall down from the sky, and the Nambicuara will be buried again. In short, they will go back

756 by singing calls his *anúnsu*, who eventually comes
754 up out of the ground in front of him. The *anúnsu* may be in the form of a bird or a jaguar, but is very small in size. The shaman wears a hat made from a jaguar skin and a necklace made from jaguar claws and teeth. The shaman offers the hat and the necklace to his *anúnsu* if he will do his bidding. If the *anúnsu* is satisfied with the singing and the decorations he will carry out the sha-
755 man's orders. The procedure followed in curing an individual who has been made ill by sorcery is much the same. The shaman calls his *anúnsu* by singing and asks that he help him draw out the object. The *anúnsu* enters the shaman, who then sucks out the dangerous object. In mild cases the shaman draws out bamboo slivers, but in cases of severe illness he draws out the bones of fish or the entrails of birds.

775 The ghosts of the dead (*aydnkadisu*) who live around the stone mountain from which the Nambicuara came, periodically come to the villages and camps asking for food. They are not dangerous if they are well-treated. When the shaman says that the *aydnkadisu* are around, the people prepare manioc cakes, roast ears of maize, and broil meat. They then gather around the shaman and sing together with the ghosts. The shaman thanks the ghosts for their singing and they finally go away. If the ghosts are dissatisfied with
● [753] the offerings and the singing they become angry
[755] and make the children ill. To cure the children, a more elaborate feast has to be prepared for the ghosts.

775 In every case, contact with the ghosts of the
533 dead or with the spirits of dead shamans is made through singing. The Wakítisu do not use tobacco, drums, or rattles to communicate with the supernatural. One becomes a shaman when he hears the song of an *anúnsu*, which he later uses whenever he wishes to contact his spirit helper. Everyone in the band appears to know the songs which bring the *aydnkadisu*. Shamans practice
[834 continence before important rites, for if the
756] *anúnsu* observe sexual intercourse they become angry and take away all the cotton from the bushes.

757 In addition to treating illness through shamanistic practices, the Nambicuara resort to more practical methods. They brew herbs, the juice of which is later poured over the head or stomach of a

776 under the ground from where *oklihdilliu*, the culture hero, once released them. They add that they expect this to happen some day.

756 The man who is responsible for guarding the band against evil spirits is the shaman (*wantingi-*
775 *diu*). In this task he is assisted by the ghosts of dead shamans of his own band. The spirit or ghost of a dead shaman is known as *anúnu* and is sharply distinguished from the ghosts of non-shamans (*aydnkadiu*). The *anúnu* of other bands, however, are considered evil for they bring thunderstorms. When speaking about shamans and shaman spirits in Portuguese, the Nambicuara refer to both as "trovão" (thunder). This has led many observers to the conclusion that the Nambicuara believe in a thunder spirit. Among the Wakítisu, at least, "trovão" or thunder is nothing more than a shaman or a shaman spirit. Actual thunder, which is caused by a shaman spirit is called *tlidítu*. A shaman spirit may also enter the body of a jaguar (*yendru*), and cause harm to people.

821 The Nambicuara do not like heavy and prolonged rainstorms, for they say that the winds blow down their houses, the lightning sometimes kills people, and the rains wash away the tracks so that they and their dogs have difficulty in following game. To pacify the evil *anúnu*, who
756 has caused the storm, the shaman makes a cigar-
789 shaped bundle (*yakúdenánu*) out of certain dry leaves, which he ties with cotton twine, leaving long tails at each end. When he wants to stop the rain he lights one end of the bundle, and as it begins to smoke he waves it in the direction of the storm, telling the rain to go away. "Go away, go away, don't be angry at me," he says as he waves the bundle four times. If this does not stop the rain the shaman takes the sword club (*halúnkiu*), which appears to have magical powers, and cuts the rain. If the rain still persists, he lights three smudges made by mixing "para toda" leaves with the *yakúndenánu* leaves. When the smoke rises from the smudges he takes a burning brand and waves it against the storm telling it to stop.

756 The shamans of one band also practice sorcery against individuals in another band by asking
● 754 their *anúnu* to inject objects into their bodies. When a shaman wishes to inject an object into his enemy he retires into a special hut (*sihdentsu*) and

756 by singing calls his *anúnsu*, who eventually comes
754 up out of the ground in front of him. The *anúnsu* may be in the form of a bird or a jaguar, but is very small in size. The shaman wears a hat made from a jaguar skin and a necklace made from jaguar claws and teeth. The shaman offers the hat and the necklace to his *anúnsu* if he will do his bidding. If the *anúnsu* is satisfied with the singing and the decorations he will carry out the shaman's orders. The procedure followed in curing
755 an individual who has been made ill by sorcery is much the same. The shaman calls his *anúnsu* by singing and asks that he help him draw out the object. The *anúnsu* enters the shaman, who then sucks out the dangerous object. In mild cases the shaman draws out bamboo slivers, but in cases of severe illness he draws out the bones of fish or the entrails of birds.

775 The ghosts of the dead (*aydnkadisu*) who live around the stone mountain from which the Nambicuara came, periodically come to the villages and camps asking for food. They are not dangerous if they are well-treated. When the shaman says that the *aydnkadisu* are around, the people prepare manioc cakes, roast ears of maize, and broil meat. They then gather around the shaman and sing together with the ghosts. The shaman thanks the ghosts for their singing and they finally go away. If the ghosts are dissatisfied with
[753] the offerings and the singing they become angry and make the children ill. To cure the children,
[755] a more elaborate feast has to be prepared for the ghosts.

775 In every case, contact with the ghosts of the dead or with the spirits of dead shamans is made
533 through singing. The Waklîtisu do not use tobacco, drums, or rattles to communicate with the supernatural. One becomes a shaman when he hears the song of an *anúnsu*, which he later uses whenever he wishes to contact his spirit helper. Everyone in the band appears to know the songs which bring the *aydnkadisu*. Shamans practice
[834 continence before important rites, for if the
756] *anúnsu* observe sexual intercourse they become angry and take away all the cotton from the bushes.

757 In addition to treating illness through shamanistic practices, the Nambicuara resort to more practical methods. They brew herbs, the juice of which is later poured over the head or stomach of a

injection of pao preto (ikatu n$\hat{a}$ŝeram, a1), put in the eye with the aid of a funnel of leaves from whose lower extremity the liquid falls drop by drop. But other maladies, considered the result of poisoning (or of a charm; in both cases: nãnde) are exclusively within the domain of the sorcerer. He makes the "arrows of thunder" (ndaõrede, b1) in all points similar to those used for hunting except that their dimensions are much more restricted. The treatment consists of three operations: throwing the arrows around the sick person to carry away the spirits; sucking the body to force out the cause of the illness; this cause is thrown far away when it has been captured:

43. ãdige underãdige kadirẽnka ũngeraige tenũndige (b1)
throw, throw far away the little thorns sucked with the mouth, throw away [the evil]. (1)

1. The informant made it known that by "little thorns" he meant to designate the "arrows of thunder" which are only several centimeters in length. One notes the same assimilation in other regions of South America. Thus, the informant of Karsten in the Chaco (R. Karsten, "Indian tribes of the Argentine and Bolivian Chaco," Societas Scientiarum Fennicae, Commentationes Humanorum Litterarum, IV, 1, p. 132-133) cites as the cause of the malady and the way of combatting it, an "arrow" or "splinter").

[103] Afterwards the sick person is usually cured and can take up his work again:

44. enẽndige deẽndige enẽna dẽidnige (b1)
To be sick is finished [one can] continue.

However, the sorcerer can establish much closer relationships with the supernatural powers. During our stay in his group, C20 disappeared, or more exactly did not return to camp at the usual hour. The other men, having gone hunting, had not seen him the whole day. Night fell and toward nine or ten o'clock in the evening, the most profound consternation reigned in the camp and particularly around the fire of the man who had disappeared, whose two wives and child held themselves embraced while mourning in advance the death of their husband and father. At this moment we decided to look around, accompanied by a few Indians. We had only to walk 200 meters to discover C20, crouched on the ground and shivering in the darkness. He was completely naked, that is, divested of his

601 Fire 6 (19 to 22). --The chief, or rather, it seems, the shaman of
621 group c, is 30 to 40 years old, "brother" of c23. His dispositions are
[754] friendly and mysterious. We shall encounter him farther on (2). He

2. P. 103.

has two wives, c19 and [54] c21, very pretty girls of 17 or 18 years, "sisters" of the dead husband of c23. Here we have, then, a good example of sororal polygyny. The second woman has a little boy of 3 years, C22.

Fire 7 (23 to 25). --The woman, c23, is over 40; she is a widow and seems to enjoy great consideration. Her numerous "brothers" provide for her as well as her children, and like C20, she is apt to receive supernatural revelations (1). She has a son, C25, about 14

1. Cf. p. 101.

years old, and a daughter, c24, about 10. Concerning them, refer to page 34.

Fire 8 (26 and 27). --A young couple of about 18, whose parents must be dead and whom the elders of the group call "grandchildren."

Fire 9 (28 to 30). --C28, about 25 years, is a "son" of C6; his wife, c29 is older than he (over 40); she is called "daughter" by c19 and c21, although they are by far younger than she; her daughter c30 is about 2 years old.

Fire 10 (31 to 33). --c32, about 40 years old, is a younger sister of c23; she has two daughters: the eldest, c31, about 17, is married; the younger, c33, still a baby. The husband and her son-in-law are absent; they are said to be on a trip together. The group sees to the needs of the two women.

It is suitable to add a visitor to this list, C34, about 30 years old.
[574] He is the brother of c12 and, during his stay, he receives the hospitality of household number 4.

RELATIONSHIPS BETWEEN INDIVIDUALS

Husbands and Wives

593 To understand well the attitude of the two sexes as concerns one another, it is indispensable to keep in mind the fundamental character

collectively obliged to make reprisals for an injury done one of its members. Much more often, given the very lively and permanent animosity which reigns between the groups, these pretexts good for exciting the spirit are voluntarily entertained, especially if they feel strong either because of the importance of the group's strength or because of an alliance with neighboring bands against a common enemy, concluded by the intermediary of messengers acting as ambassadors. The proposition of war is presented by an exalted individual or one who exposes before his companions his particular griefs, in the same tone and style that speeches were made at the encounter.

39. ẽ̃ akinãẽ̃ ẑednãẽ̃ gõdegãẽ̃ kakonẑẽ̃ ordnẑẽ̃ yalaŋ̂ẽnẑẽ̃.(b1) whose approximate sense is: "Hello! Come here! Let's go! I am irritated! very irritated! arrows! big arrows!" The Indians become so excited upon the occasion of these epic speeches that it is not possible to obtain the commentary of the formula except well after they have been cited and undoubtedly very unfaithfully. But war is not a matter of purely profane decision. It necessitates a preliminary ceremony which will determine if the signs are favorable or not. Dressed in special attire, tufts of buriti straw dappled with red, hoods of jaguar skin, the men assemble under the leadership of the chief and execute the special dance and chant of war. (1) A divining rite

1. Dances and music will be the object of a special publication.

is then performed. The chief, or the sorcerer in the groups where he exists, goes solemnly to hide an arrow in a corner of the bush. The arrow is retrieved the next day. If it is covered with blood, the expedition is undertaken, if not, it is given up. (2) Many warlike

2. This symbolic use of an arrow seems typical of cultures situated north of the Amazon. The fact is interesting, given the northern affinities of the Nambikwara language. Concerning the use of the arrow as the message of war, cf. Roth, "An inquiry," etc., Annual report of the Bureau of American Ethnology, 30, p. 362; Koch-Grünberg, Zwei Jahre unter den Indianern, etc., Berlin, 1910, Vol. II, p. 316; Gumilla, Historia Natural del Rio Orinoco, Barcelona, 1791, Vol. I, p. 134.

expeditions thus begun and after several kilometers of marching,

787 These visions are attributed to the thunder which sends them to men under its semi-personal form amõ.

771 Thus the Nambikwara conceive of three types of supernatural
756 forces: first the power which is abstract, but placed in objects or substances, the inate, next the spirits acting in the form of super-natural or seminatural animals, atasu or jaguar. Finally the thunder, with which under certain conditions, it is possible to entertain personal relations. Each individual can, in a certain measure, establish contact with these forces, however it is the shamans who have the specialized function of intermediary between the human group and the supernatural world. The information which we shall give on this point will be very summary, for it was impossible to obtain from our informants a coherent treatment of the question of shamanism. None of the groups encountered had a shaman with the exception of a single one (group c) where the powers of the chief and the sorcerer were found [102] concentrated in a single individual (C20). Our best informant, B1, chief of the allied group, was categorical concerning the fact that C20 combined the two qualities of uelikabala (chief, c) and of ndare (thunder, c) although he was only uilikãde, temporal chief. The sorcerer would then be simultaneously the man who identifies himself with thunder, and who communicates with it in the personal form called amõ. Likewise, in the eastern groups (a1 restricted and enlarged, and a2), it was not possible to uncover the presence of a sorcerer or of an individual with such powers. This fact could be interpreted in three different ways: that the sorcerers were held apart; or that they dissimulated their nature; that the institution of the sorcerer is, in fact, absent in certain groups; or that, in these same groups, the functions of the sorcerer are exercised by the chief, and that, in inverse fashion to what is produced in group c, it is the spiritual functions which are in second place with regard to the temporal. It is this hypothesis which we consider the most reasonable. In group a1; A1 makes the arrow poison and treats sick persons by suction, functions which in group c come within the province of C20 considered as shaman, rather than chief of the group.

756 Whatever the fact may be, and as we have just said, it is the sorcerer who makes the poisons, and it is he who proceeds to the magical treatment of the sick, clearly different from the positive
278 therapeutics likewise practiced. The Nambikwara are familiar with
757 quite a large number of medicinal plants and treat certain illnesses with their help. Thus they care for purulent ophthalmia by an

injection of pao preto (ikatu n̂erə̂m, a1), put in the eye with the aid of a funnel of leaves from whose lower extremity the liquid falls drop by drop. But other maladies, considered the result of poisoning (or of a charm; in both cases: nãnde) are exclusively within the domain of the sorcerer. He makes the "arrows of thunder" (ndadrede, b1) in all points similar to those used for hunting except that their dimensions are much more restricted. The treatment consists of three operations: throwing the arrows around the sick person to carry away the spirits; sucking the body to force out the cause of the illness; this cause is thrown far away when it has been captured:

43. ãdige underãdige kadirjenka ungerajge tenundige (b1)
throw, throw far away the little thorns sucked with the mouth, throw away [the evil]. (1)

1. The informant made it known that by "little thorns" he meant to designate the "arrows of thunder" which are only several centimeters in length. One notes the same assimilation in other regions of South America. Thus, the informant of Karsten in the Chaco (R. Karsten, "Indian tribes of the Argentine and Bolivian Chaco," Societas Scientiarum Fennicae, Commentationes Humanorum Litterarum, IV, 1, p. 132-133) cites as the cause of the malady and the way of combatting it, an "arrow" or "splinter").

[103] Afterwards the sick person is usually cured and can take up his work again:

44. enendige deendige enena dednige (b1)
To be sick is finished [one can] continue.

However, the sorcerer can establish much closer relationships with the supernatural powers. During our stay in his group, C20 disappeared, or more exactly did not return to camp at the usual hour. The other men, having gone hunting, had not seen him the whole day. Night fell and toward nine or ten o'clock in the evening, the most profound consternation reigned in the camp and particularly around the fire of the man who had disappeared, whose two wives and child held themselves embraced while mourning in advance the death of their husband and father. At this moment we decided to look around, accompanied by a few Indians. We had only to walk 200 meters to discover C20, crouched on the ground and shivering in the darkness. He was completely naked, that is, divested of his

He was completely naked, that is, divested of his
756 necklaces, bracelets, earrings, and belt, and by the light of our
[301] electric lamps we could make out his tragic expression and his pale complexion. He let himself be helped to the camp without difficulty, where he sat down without a word and in a completely impressive attitude of dejection. Little by little, his story was drawn from him by an anxious listener. He explained that he had been carried off by the thunder (amõ). [a storm had broken the same day]; the thunder had carried him in the air to a point which he designated at a distance of 25 kilometers from the camp (Ananáz River), had divested him of all his ornaments, then brought him back the same way and left him in the place where we had discovered him exhausted. Everyone went to sleep commenting on the incident and the next morning, C20 had recovered not only his habitual good humor, but also all his ornaments, which amazed no one and for which he offered no explanation. But the following days a very different version of the event began to be peddled by the Tarundé. They said that, far from having entered into relationship with the other world, C20, under the cover of a magical disappearance, had gone to undertake
[578] some transactions with a band of Sabané Indians who were camping in the vicinity. These insinuations were never developed further, and the official version of the affair continued to be ostensibly admitted. However, in our personal relationships, B1 let his preoccupations be seen upon several occasions. As the two groups left us shortly after, we never found out the outcome of the story.

756 No information has been uncovered concerning the manner of
278 naming the shaman as such. In the preparation of the arrow poison, C20 was assisted by his potential son-in-law C25.

• • • • • •

622 [104] Besides his supernatural attributes, the chief, or shaman,
756 plays another role, that of "leader" in ceremonies and celebrations.
796 The Nambikwara have three types of ceremonies. Those which mark the critical moments of each one's existence, such as birth, initiation, puberty, marriage, death; the seasonal festivals; and finally, the ceremonies celebrated on exceptional occasions: war and hunting or scavenging expeditions. We have already alluded to the rites of war, and we shall speak farther on of the ceremonies of the first type. We shall limit ourselves here then to some brief observations concerning the others.

particular form of their own. Death is identified with these spirits. Men's souls are believed to be reincarnated as jaguars, whereas women's and children's souls are taken away by wind and thunder, never to return.

The highest being is the Thunder, with which any man, though usually a shaman, may have personal contact through revelations and visions. Women, however, except when very old, and children are deprived of these privileges. Women are also forbidden, under pain of death, to see the sacred flageolets (see Musical Instruments, p. 368) played at the ceremonies marking the beginning and the end of the dry season.

SHAMANISM AND MEDICINE

The shaman is sometimes distinct from—but more frequently identified with—the political chief. He is distinguished by having the privilege of polygyny, playing the leading role in ceremonial life, and possessing special supernatural powers. He treats patients by sucking out the disease or by fighting it with small ritual arrows called "thunder-arrows."

In addition to magical cures, the *Nambicuara* treat sickness with numerous medicinal plants, which are used externally or internally according to the disease. For eye infection, which is very frequent, they apply the infusion of a special bark with the help of a container made of leaves.

FOLKLORE, LORE, AND LEARNING

The only legend recorded by Lévi-Strauss (n.d. b) is a flood tale relating the destruction of human life and its re-creation through several incestuous marriages between the offspring of an old woman, who was the only being who escaped the disaster.

The only basic numbers used for counting are one and two, but the natives can reckon higher figures by combining these.

Colors are classified differently according to the dialects. The *Eastern, Central, Southern,* and *Western Nambicuara* agree in putting yellow and green in the same category, whereas the *Northern* group identify red and yellow, and class green, blue, and black together.

Some *Nambicuara* groups call stars by the same name which designates the spirits. The year is divided into two seasons and an undetermined number of lunar months. The day includes six main stages, each based on the position of the sun. Space is divided into two sections that are perpendicular to each other, one corresponding to the apparent movement of the sun and the other to the direction of the main waterways.

of skill and initiative are the prerequisites of a good leader. It is he who makes the arrow-poison, although the preparation of *curare* among the Nambikuara is a purely profane activity surrounded by no ceremonial taboos or magic prescriptions. It is he, also, who makes the rubber ball used in the head-ball games which are played occasionally. The chief must be a good singer and dancer, a merrymaker always ready to cheer up the band and to brighten the dullness of daily life. This could easily lead to shamanism; and, in some cases, I have met with chiefs who were at the same time healers and trance addicts. Mystical life, however, is kept in the background among the Nambikuara, and, wherever they exist, magical functions are only secondary attributes of the leader. More often chieftainship and sorcery are divided between two different individuals. In this respect, there is a strong difference between the Nambikuara and their northwestern neighbors the Tupi-Kawahib among whom the chief is, first of all, a shaman, usually a psychotic addicted to dreams, visions, trances and impersonations.

But although they are oriented in a more positive direction, the Nambikuara chief's skill and ingenuity are none the less amazing. He must have a perfect knowledge of the territories haunted by his and other groups, be familiar with the hunting grounds, the location of fruit-bearing trees and the time of their ripening, have some idea of the itineraries followed by other bands, whether hostile or friendly. Therefore, he must travel more, and more quickly, than his people, have a good memory, and sometimes gamble his prestige on hazardous contacts with foreign and dangerous people. He is constantly engaged in some task of reconnoitering and exploring, and seems to flutter around his band rather than lead it.

Except for one or two men without actual power, but eager to cooperate and to receive occasional rewards, the passivity of the band makes a strong contrast with its dynamic leader. It seems as if the band, having relinquished certain advantages to the chief, were in exchange relying entirely upon him for its interests and safety. I received a particularly striking demonstration of this under rather strange circumstances. After several weeks' discussion, I had obtained from a chief the favor of taking me, together with a few companions and some animals loaded with presents, to the semi-permanent dwellings of his band which were uninhabited at that time. This was a chance for me to penetrate more deeply into the unexplored Nambikuara territory

ORNAMENTATION

301 The Eastern Nambicuara also make a wide assortment of ornaments from tucum nuts, shell,
306 teeth, and bamboo. From the shell of the tucum nut they make black washers which are strung for necklaces or ear ornaments. The irregular-shaped washers are first ground down to an almost paper-like thinness on a piece of sandstone. They are then strung tightly on a string and the maker begins to rub them against a stone in order to make them circular. He continues rubbing until the washers are no more than a quarter of an inch in diameter, for the smaller the washer the more highly the necklace is valued, as this process takes many weeks.

301 The ear lobes of both men and women are per-
304 forated so that tucum shell washers, beads on a string, and triangular pieces of shell can be suspended from them.

The septum of the nose and the upper lips of men are perforated. Through the hole in the septum they force a slender piece of bamboo about 2 inches in length. These adornments give a peculiar expression to the face, particularly when the man is speaking. Julio was especially proud of these ornaments and claimed that white men were just like women because they did not wear them. On special occasions a blue macaw feather [292] [756] about 10 inches long with a bunch of red feathers near the lower end is worn in the nose. Only shamans wear a hat made from jaguar skin.

301 The most popular necklace is made from tucum washers and is worn by men, women, and children. Short lengths of bamboo, monkey teeth, jaguar teeth and claws are also used for making necklaces for men. If very long, any necklace can be worn over one shoulder and under the arm. A special type of necklace for men is made by suspending black mutúm feathers from a string alternating with lengths of bamboo. Generally the feathers also alternate, some being long and some short. A rare but highly valued necklace is made from the shiny black horns of a large beetle.

Arm bands about an inch in width made of woven cotton are worn above the biceps by both men and women. From these, men suspend tassels of buriti fiber. This fiber is also worn around the wrists and ankles. Wrist bands are also made for women from the tail of the armadillo.

[p. 95(B)]

776 [753] *Tauptú* does not cause illness, but when people get sick he begins to eat away the flesh and finally kills them and eventually takes their bones to his abode in the sky. The missionaries told me that when the first airplane appeared in Nambicuara territory the Indians ran into the forest and hid because they believed the airplane was *tauptú*. Shamans sometimes visit the land of *tauptú* by riding up to the sky on the back of [756] *urutai*, the night hawk or goat sucker. Julio claimed that his father-in-law, who was a powerful shaman, had visited the realm of *tauptú* while in a trance.

776 756 The Wakítisu fear most of all the spirit armadillo called *ulurú*. When someone sees bits of manioc cake and charcoal floating on the river near the village, he comes back and tells the shaman, who then goes to examine the signs. If the shaman decides that it is *ulurú*, immediate action must be taken to save the world from destruction. The women and children shut themselves in their huts while the men take their wooden sword clubs (*hulúkisu*) and go to the bank of the river. The shaman then digs a deep hole in the bank, into which he is lowered with a rope. When he has grasped *ulurú* by the tail he signals the men on the surface to pull him out. The shaman remains at the mouth of the hole with his arm thrust in, holding *ulurú* by the tail while with his other hand he marks points on the ground which are directly over the head, heart, and stomach of *ulurú*. One by one the men thrust their sword clubs into the ground at the places marked by the shaman. As they push the blades in they twist them to make sure that they kill *ulurú*. After the spirit armadillo has been killed, the men go back to the village leaving the shaman alone with the dead *ulurú*. The shaman then cuts up the spirit armadillo, washes the pieces in the river, and begins to sing. When the ghosts of the dead Nambicuara hear the song they come and eat the pieces prepared by the shaman, after which they go away happy because the Nambicuara have been saved.

776 [821] The Wakítisu say that if they should ever fail to kill *ulurú*, a terrific storm would appear followed by an earthquake, for when *ulurú* gets under the village he will turn the world upside down, *tauptú* will fall down from the sky, and the Nambicuara will be buried again. In short, they will go back

[p. 100 (A)]

776 under the ground from where *oklihdítisu*, the culture hero, once released them. They add that they expect this to happen some day.

●756 The man who is responsible for guarding the
775 band against evil spirits is the shaman (*wanîngidisu*). In this task he is assisted by the ghosts of dead shamans of his own band. The spirit or ghost of a dead shaman is known as *anúnsu* and is sharply distinguished from the ghosts of non-shamans (*ayánkadisu*). The *anúnsu* of other bands, however, are considered evil for they bring thunderstorms. When speaking about shamans and shaman spirits in Portuguese, the Nambicuara refer to both as "trovão" (thunder). This has led many observers to the conclusion that the Nambicuara believe in a thunder spirit. Among the Waklítisu, at least, "trovão" or thunder is nothing more than a shaman or a shaman spirit. Actual thunder, which is caused by a shaman spirit is called *tlídítu*. A shaman spirit may also enter the body of a jaguar (*yendru*), and cause harm to people.

821 The Nambicuara do not like heavy and prolonged rainstorms, for they say that the winds blow down their houses, the lightning sometimes kills people, and the rains wash away the tracks so that they and their dogs have difficulty in
756 following game. To pacify the evil *anúnsu*, who
789 has caused the storm, the shaman makes a cigar-shaped bundle (*yakúdendnsu*) out of certain dry leaves, which he ties with cotton twine, leaving long tails at each end. When he wants to stop the rain he lights one end of the bundle, and as it begins to smoke he waves it in the direction of the storm, telling the rain to go away. "Go away, go away, don't be angry at me," he says as he waves the bundle four times. If this does not stop the rain the shaman takes the sword club (*kalúnkisu*), which appears to have magical powers, and cuts the rain. If the rain still persists, he lights three smudges made by mixing "para toda" leaves with the *yakúndendnsu* leaves. When the smoke rises from the smudges he takes a burning brand and waves it against the storm telling it to stop.

756 The shamans of one band also practice sorcery
754 against individuals in another band by asking their *anúnsu* to inject objects into their bodies. When a shaman wishes to inject an object into his enemy he retires into a special hut (*sihdentsu*) and

756 by singing calls his *anúnsu*, who eventually comes
754 up out of the ground in front of him. The *anúnsu* may be in the form of a bird or a jaguar, but is very small in size. The shaman wears a hat made from a jaguar skin and a necklace made from jaguar claws and teeth. The shaman offers the hat and the necklace to his *anúnsu* if he will do his bidding. If the *anúnsu* is satisfied with the singing and the decorations he will carry out the shaman's orders. The procedure followed in curing
755 an individual who has been made ill by sorcery is much the same. The shaman calls his *anúnsu* by singing and asks that he help him draw out the object. The *anúnsu* enters the shaman, who then sucks out the dangerous object. In mild cases the shaman draws out bamboo slivers, but in cases of severe illness he draws out the bones of fish or the entrails of birds.

775 The ghosts of the dead (*aydnkadisu*) who live around the stone mountain from which the Nambicuara came, periodically come to the villages and camps asking for food. They are not dangerous if they are well-treated. When the shaman says that the *aydnkadisu* are around, the people prepare manioc cakes, roast ears of maize, and broil meat. They then gather around the shaman and sing together with the ghosts. The shaman thanks the ghosts for their singing and they finally go away. If the ghosts are dissatisfied with
[753] the offerings and the singing they become angry and make the children ill. To cure the children,
[755] a more elaborate feast has to be prepared for the ghosts.

775 In every case, contact with the ghosts of the
533 dead or with the spirits of dead shamans is made through singing. The Waklítisu do not use tobacco, drums, or rattles to communicate with the supernatural. One becomes a shaman when he hears the song of an *anúnsu*, which he later uses whenever he wishes to contact his spirit helper. Everyone in the band appears to know the songs
[834 which bring the *aydnkadisu*. Shamans practice
756] continence before important rites, for if the *anúnsu* observe sexual intercourse they become angry and take away all the cotton from the bushes.

757 In addition to treating illness through shamanistic practices, the Nambicuara resort to more practical methods. They brew herbs, the juice of which is later poured over the head or stomach of a

619 which cause sickness, they have given the magical herbs whose smoke blinds the dangerous *anúnsu*, and the techniques which will drive away the storms. Thus the shaman operating on a symbolic level continues the struggle for survival which has been defined for the Nambicuara by the nature of their adjustment to their physical environment and their relationships to one another.

THE LIFE CYCLE

BIRTH

833 The Nambicuara recognize sexual intercourse (*winsúenditsu*) as the cause of pregnancy (*haldjítsu*). This act takes place in the woods while the husband and wife are out hunting or collecting, for it is considered improper to have sexual intercourse in public, even at night around the common camp fire. If a shaman should see a couple in sexual embrace while practicing his rites it would spoil his power. Although shamans use a special hut when calling their *anúnsu* there is always a chance that they may see a couple in the sexual act, so every effort must be made to avoid this danger. Shamans themselves abstain from sexual intercourse for 2 or 3 days before getting in contact with the spirits.

843 There appear to be no food taboos surrounding pregnancy among the Wakĺtisu. The husband continues hunting and collecting as usual, but he must avoid working too hard in the field for fear of causing his wife to abort. Women do not practice abortion, and the Nambicuara did not mention any medicines used for this purpose. Honey is considered conducive to sexual vigor and is used by young couples. Childless marriages are attributed to sterility in women, and a man may abandon his wife for this reason.

844 Birth takes place in the house, or in the camp if the family is out hunting. Just before expecting the birth of a child the expectant mother drinks the juice of certain herbs which are believed to facilitate birth. The husband and two older women assist in the delivery. The woman kneels on the ground and is supported by her husband. The umbilical cord is tied with a certain vine and then cut with a bamboo sliver. Among the Kitánrhu it is bitten off by one of the midwives. The placenta is buried at the place of birth and when the umbilical cord dries and falls off, it, too,

[p. 102 (B)]

787 These visions are attributed to the thunder which sends them to men under its semi-personal form amõ.

771 Thus the Nambikwara conceive of three types of supernatural
756 forces: first the power which is abstract, but placed in objects or substances, the nãnde; next the spirits acting in the form of supernatural or seminatural animals, atãsu or jaguar. Finally the thunder, with which under certain conditions, it is possible to entertain personal relations. Each individual can, in a certain measure, establish contact with these forces, however it is the shamans who have the specialized function of intermediary between the human group and the supernatural world. The information which we shall give on this point will be very summary, for it was impossible to obtain from our informants a coherent treatment of the question of shamanism. None of the groups encountered had a shaman with the exception of a single one (group c) where the powers of the chief and the sorcerer were found [102] concentrated in a single individual (C20). Our best informant, B1, chief of the allied group, was categorical concerning the fact that C20 combined the two qualities of uelikabala (chief, c) and of ndãre (thunder, c) although he was only uilikãde, temporal chief. The sorcerer would then be simultaneously the man who identifies himself with thunder, and who communicates with it in the personal form called amõ. Likewise, in the eastern groups (a1 restricted and enlarged, and a2), it was not possible to uncover the presence of a sorcerer or of an individual with such powers. This fact could be interpreted in three different ways: that the sorcerers were held apart; or that they dissimulated their nature; that the institution of the sorcerer is, in fact, absent in certain groups; or that, in these same groups, the functions of the sorcerer are exercised by the chief, and that, in inverse fashion to what is produced in group c, it is the spiritual functions which are in second place with regard to the temporal. It is this hypothesis which we consider the most reasonable. In group a1; A1 makes the arrow poison and treats sick persons by suction, functions which in group c come within the province of C20 considered as shaman, rather than chief of the group.

756 Whatever the fact may be, and as we have just said, it is the sorcerer who makes the poisons, and it is he who proceeds to the magical treatment of the sick, clearly different from the positive
275 therapeutics likewise practiced. The Nambikwara are familiar with
● 757 quite a large number of medicinal plants and treat certain illnesses with their help. Thus they care for purulent ophthalmia by an

injection of pao preto (ikãtu nẽʔẽrãm, a1), put in the eye with the aid of a funnel of leaves from whose lower extremity the liquid falls drop by drop. But other maladies, considered the result of poisoning (or of a charm; in both cases: nãnde) are exclusively within the domain of the sorcerer. He makes the "arrows of thunder" (ndaõrede, b1) in all points similar to those used for hunting except that their dimensions are much more restricted. The treatment consists of three operations: throwing the arrows around the sick person to carry away the spirits; sucking the body to force out the cause of the illness; this cause is thrown far away when it has been captured:

43. ãdige underãdige kadirẽnka ũngeraige tenũndige (b1)
throw, throw far away the little thorns sucked with the mouth, throw away [the evil]. (1)

1. The informant made it known that by "little thorns" he meant to designate the "arrows of thunder" which are only several centimeters in length. One notes the same assimilation in other regions of South America. Thus, the informant of Karsten in the Chaco (R. Karsten, "Indian tribes of the Argentine and Bolivian Chaco," Societas Scientiarum Fennicae, Commentationes Humanorum Litterarum, IV, 1, p. 132-133) cites as the cause of the malady and the way of combatting it, an "arrow" or "splinter").

[103] Afterwards the sick person is usually cured and can take up his work again:

44. enẽndige deẽndige enẽna dẽdnige (b1)
To be sick is finished [one can] continue.

However, the sorcerer can establish much closer relationships with the supernatural powers. During our stay in his group, C20 disappeared, or more exactly did not return to camp at the usual hour. The other men, having gone hunting, had not seen him the whole day. Night fell and toward nine or ten o'clock in the evening, the most profound consternation reigned in the camp and particularly around the fire of the man who had disappeared, whose two wives and child held themselves embraced while mourning in advance the death of their husband and father. At this moment we decided to look around, accompanied by a few Indians. We had only to walk 200 meters to discover C20, crouched on the ground and shivering in the darkness. He was completely naked, that is, divested of his

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

particular form of their own. Death is identified with these spirits. Men's souls are believed to be reincarnated as jaguars, whereas women's and children's souls are taken away by wind and thunder, never to return.

The highest being is the Thunder, with which any man, though usually a shaman, may have personal contact through revelations and visions. Women, however, except when very old, and children are deprived of these privileges. Women are also forbidden, under pain of death, to see the sacred flageolets (see Musical Instruments, p. 368) played at the ceremonies marking the beginning and the end of the dry season.

SHAMANISM AND MEDICINE

The shaman is sometimes distinct from—but more frequently identified with—the political chief. He is distinguished by having the privilege of polygyny, playing the leading role in ceremonial life, and possessing special supernatural powers. He treats patients by sucking out the disease or by fighting it with small ritual arrows called "thunder-arrows."

In addition to magical cures, the *Nambicuara* treat sickness with numerous medicinal plants, which are used externally or internally according to the disease. For eye infection, which is very frequent, they apply the infusion of a special bark with the help of a container made of leaves.

FOLKLORE, LORE, AND LEARNING

The only legend recorded by Lévi-Strauss (n.d. b) is a flood tale relating the destruction of human life and its re-creation through several incestuous marriages between the offspring of an old woman, who was the only being who escaped the disaster.

The only basic numbers used for counting are one and two, but the natives can reckon higher figures by combining these.

Colors are classified differently according to the dialects. The *Eastern, Central, Southern,* and *Western Nambicuara* agree in putting yellow and green in the same category, whereas the *Northern* group identify red and yellow, and class green, blue, and black together.

Some *Nambicuara* groups call stars by the same name which designates the spirits. The year is divided into two seasons and an undetermined number of lunar months. The day includes six main stages, each based on the position of the sun. Space is divided into two sections that are perpendicular to each other, one corresponding to the apparent movement of the sun and the other to the direction of the main waterways.

756 by singing calls his *anánsu*, who eventually comes
754 up out of the ground in front of him. The *anánsu* may be in the form of a bird or a jaguar, but is very small in size. The shaman wears a hat made from a jaguar skin and a necklace made from jaguar claws and teeth. The shaman offers the hat and the necklace to his *anánsu* if he will do his bidding. If the *anánsu* is satisfied with the singing and the decorations he will carry out the shaman's orders. The procedure followed in curing
755 an individual who has been made ill by sorcery is much the same. The shaman calls his *anánsu* by singing and asks that he help him draw out the object. The *anánsu* enters the shaman, who then sucks out the dangerous object. In mild cases the shaman draws out bamboo slivers, but in cases of severe illness he draws out the bones of fish or the entrails of birds.

775 The ghosts of the dead (*aydnkadisu*) who live around the stone mountain from which the Nambicuara came, periodically come to the villages and camps asking for food. They are not dangerous if they are well-treated. When the shaman says that the *aydnkadisu* are around, the people prepare manioc cakes, roast ears of maize, and broil meat. They then gather around the shaman and sing together with the ghosts. The shaman thanks the ghosts for their singing and they finally go away. If the ghosts are dissatisfied with
[753] the offerings and the singing they become angry
[755] and make the children ill. To cure the children, a more elaborate feast has to be prepared for the ghosts.

775 In every case, contact with the ghosts of the
533 dead or with the spirits of dead shamans is made through singing. The Waklítisu do not use tobacco, drums, or rattles to communicate with the supernatural. One becomes a shaman when he hears the song of an *anánsu*, which he later uses whenever he wishes to contact his spirit helper. Everyone in the band appears to know the songs which bring the *aydnkadisu*. Shamans practice
[834] continence before important rites, for if the
756] *anánsu* observe sexual intercourse they become angry and take away all the cotton from the bushes.

●757 In addition to treating illness through shamanistic practices, the Nambicuara resort to more practical methods. They brew herbs, the juice of which is later poured over the head or stomach of a

757 patient. The juice of a certain plant is put into the cavities of teeth to stop toothache. The juice of boiled roots and leaves are taken internally for stomach disorders. One day I observed a woman pressing her foot over her husband's forehead as he lay on the ground. The heel was placed over the eye and she exerted considerable pressure. She was doing this to cure her husband's headache. These nonmagical practices are known to everyone. Some herbal medicines, however, are known only to the shamans and are used under the directions of the *anúnsu*.

778 534 The sacred flutes (*wdinrhu*) are associated with *ohlihditlisu*, the culture hero, agriculture, and chieftainship. As these flutes are similar in appearance to the sacred flutes of the Paressí, among whom they have great significance, it is possible that the Nambicuara obtained them originally from the Paressí. The flutes are about 2 feet long with four holes at the lower end and are made from a jointless piece of bamboo. When the band settles down near their manioc fields they build a special hut for the flutes, but when they are wandering around, the flutes are hidden in the [784] woods. Women are not permitted to see the flutes, and if one should accidently see them her stomach would swell and she would become ill. But what appears more important is the fact that the flutes poison people who do not treat them well. Yet, as only the chief and the head shamans play them this would mean that the flutes are the symbols of authority representing the men in whom power is invested. The flutes, four of which should be in every band, do not represent a spirit but appear to be more like fetishes. Boiled manioc juice is poured into them and they are offered maize and broiled meat.

241 775 533 The *wdinrhu* are played after the fields have been planted and again at harvest time. After planting, the men gather into the flute hut and play the flutes and sing the *wiyánsu*. The ghosts of the dead participate and, along with the flutes, are offered food and drink. At harvest time another ceremony called *haikánakídutsu* is performed at night during which the flutes are played and special songs are sung. The following day the whole band participates in a dance. The ghosts also take part in this ceremony.

534 In addition to the *wdinrhu* flutes, the Nambicuara have a smaller four-stop bamboo flute called

164 These papery scales cannot be removed easily; I noticed that they did not come off when the woman scratched herself. I believe that the itching is much less severe at this time; it seemed more intense during the initial stages.

I cannot be definite about the time span of the disease. The symptoms evolve in a few days from the first to the second stage, but the latter seems quite prolonged.

[183] Some of the scabs contain incipient papery scales. However, as I had the opportunity to see only one woman and one girl, her daughter, whose bodies were entirely covered with the lesions of the last stage, I believe that the disease does not always reach this point. It may remain stationary at the second stage, or it may recede [involuir].

For the time being, therefore, I ascribe three stages to the disease:

(a) the cyst stage
(b) the scab stage
(c) the scale stage

I believe that these correspond to evolutionary phases of the same disease, and not to different diseases, because I found transitional forms on some of the affected individuals.

Besides, [the Indians] indicated by means of very clear signs that the final symptoms began with the cyst stage, the only one found in nursing children.

[757] The Indians spread saliva on the scabs; we do not know yet [278] whether they use any herb against the disease. They probably do, for veritable herbariums were found in their villages.

302 751 Another question that remains to be solved is the possible effect on the disease of the Indians' custom of painting their body with a greasy paste made from the juice of the urucu seeds. (1)

[113]

1. Alvaro Osorio de Almeida (in the Boletim do Museu Nacional, Vol. 7, 1931, No. 1) studies the reactions of skin painted with urucu to the actinic rays of light and to solar heat. His experiments led him to the following conclusions:

"Once smeared with urucu, the

824 It is a curious fact that palm cabbage (palmito) is not utilized by the Serra do Norte Indians. Gabriel Soares [234] made it clear in 1587 that the aborigines of the coast prized the leaf buds of the palm tree: "Stupendous palm cabbages, five or six spans in length and as thick as a man's leg, are extracted from the buds of these palms."

273 Pineapple wine was a common beverage, for Soares goes on to say: "The nature of this fruit is hot and humid, and it is very harmful [278] to those with open wounds or sores; the same pineapples, when green [757] are good for curing sores, for their juice eats away all the rotten and putrid flesh, and the aborigines know this; in such wise does this fruit [279] *eat away, that they use its rind to wipe off the rust from their swords* and knives and to remove the stains from the clothes they wash; when ripe, the juice is used by the Indians to make a wine which inebriates them; to this end they pluck the fruit not quite ripe, on account of its being more sour..."

263 The Indians of the Serra do Norte found our salted food unpleasant. They often refused the plates we set before them, giving us to understand that it was the salty flavor which led them to behave in this manner.

262 Milk (condensed milk) was also rejected in the beginning; they would make a face and say that it was human milk and therefore repulsive: [235] "Anungçú!"

261 One must know the Indians' gluttony, their insatiable hunger, their continual, unfailing, artless, persistent animus devorandi, fully to comprehend the disgust which led them to such a renunciation.

262 The children are given to eat of everything; no matter what 855 goes into an Indian's mouth, there is always a crumb for the little one who walks beside him or rests in his arms.

276 Even the stimulants they use--tobacco, for instance--are shared 855 with the children. More than once I had the opportunity to observe Indians giving cigarettes to children under two. (1)

[113]

1. Cf. E. Roquette-Pinto, "A condição da criança entre os Indios do Brasil [The Status of the Child Among the Indians of Brazil," Primeiro Congresso Americano da Criança [First American Congress on Childhood] (Tucumán, 1916).

752 They spread saliva on bâanêcedûtú sores with the palm of the hand. They squeeze insect bites between two fingers.

757 Those suffering from fever go quietly into a corner, when they do not leap into running water. They eat nothing as long as the seizure lasts.

In the village on the Juina River there was an old Indian of about sixty. He was sad and prostrate and was not cheered by our gifts. He would put his hands to his head to show that it was aching. A lad who seemed [251] to be his son judging by the extreme affection he bestowed on the old man, contrary to the other Indians, kept offering him honey with water. Each time the old man would turn away. In the afternoon, his condition not having improved, he called the boy and said something to him.

The lad grasped the man's head in his hands and put his mouth against the nostrils, sucking hard. It seems that this suction which he repeated later was helpful, for the old man became more expansive.

[Fig. 41]

853 Childbirth must be easy, considering how poorly the foetus is nourished. The Indian women, when they do not have sufficient milk, take a drought of water in their mouth and put their lips onto those of the baby, transferring the liquid in a nourishing kiss.

844 I wanted to know how they cut the umbilical cord and showed several Indians who were more outgoing and intelligent--Damasceno, Nuleke, Krikriceknerá--a drawing in a book that showed a foetus with its attachments. From Damasceno's replies I understood that the mother cuts the cord with her teeth and hides the placenta under some leaves.

This piece of information obviously remains subject to revision.

531 Drawings by the Indians of the Serra do Norte, though rudimentary, reveal some interesting motifs emancipated from animal forms.

The circle, triangle and square are drawn in black on the surface of some gourds.

532 [252] Snakes and saurians are sometimes drawn sketchily(1)

113 1. See E. Roquette-Pinto, "Documentos para o estudo da psicologia dos Indios do

241 [Plates p. 254]

[249] Yet a wild form of manioc has been found (Manihot utilissimo, Pohl); if not the very species we use, at least one of the same genus. But maize?

Where on the surface of the earth does maize exist in a wild state except for the tunicated Zea mais which is sometimes considered to be the ancestor of the modern species?

What unveiling of mysteries, if this question were to be answered!

Some Tagnani who were watching the herdsman João Lucas weed a small plot in Três Buritis began to laugh at him, indicating that it would be better to root up the weeds; the hoe severed the stems but left in the roots, and the plants would grow up again. When the Nambicuara weed, they pull out everything that is not useful. Their plots are always clean.

Their tobacco is the Nicotiana that grows wild in their mountains; it may not properly be said that urucu and cotton are cultivated; they are planted and utilized. Some large beans of various kinds de-
278 241 serve mention. [250] They are to be found in the Indians' baskets along with many other plants; but we never saw an Indian eating them or making any use of them. Pending further research, I am of the opinion that they are saved for medicinal undertakings carried out in secret by old men and women. The same may be said of the castor oil plant (Ricinus communis), which is definitely adventitious.

[Fig. 39]

415 The spools of cotton fiber that await spinning and the seeds saved for future use are kept out of the weather, dust and rain in bags made of straw or pacova leaves.

[Fig. 40]

759 It seemed to us that medicine was not exercised by any special segment of society. They all take part in the treatment of certain diseases; in serious cases, an experienced elder takes over.

752 Wounds are dressed with straw fibers [coated] with certain resins (jatobá). Burns are treated with cold water. Fractures and dislocations are reduced haphazardly.

789 411 [b1], makalé [c1]. This instrument is used in three circumstances: in war; to conjure up (or to attract?) rain by manipulating it according to an approved ritual as if one were tracing signs in the air while brandishing it; finally to kill the atáisu, by throwing it in the direction of the apparition, using as intermediary a tooth of the jaguar; the throwing stick is placed obliquely in the left hand, the point turned in the direction of the atáisu, and the tooth, manipulated by the right hand, acts as a hook for projection. The atáisu appears only at night. It may borrow the form of the jaguar or of other animals who are then filled with murderous intentions. When the atáisu is caught in his terrestrial form at the point of the javelin, a great flow of blood is produced. The "supernatural" animal is never eaten. They abandon its body to the carrion.

789 761 In the second case, one is faced with a real theory of death. The sick person who sees the atáisu appear knows that he is condemned, and the animal actually carries him off on the spot or returns to get him a little later. The current version of the death of A21, drowned in a river in July 1938, was that the atáisu carried him to the bottom of the waters. The atáisu would live in the water. An informant described it as having "a large mouth and lots of collars."

789 771 74 The southern, central and northern groups bear witness to a more elaborate religious thought. Among these peoples, the preceding notions are crowned by a third, which does not appear as clearly in the eastern groups although it is probably present, that of the wind and thunder, hypostasized in the forms of a semi-personal power named amã. (1) In these groups, this is substituted for the atáisu in the theory

1. The Tupi origin of this term is evident. One can compare Montoya, 'amaː cloud of waters; Nogueira, 'amaː cloud; Coudreau (Bibliothèque Linguistique Américaine, XV, 1892), 'amane (Oyampi): rain; Gonçalves Dias, 'amanaː (chuva) rain; Kissenberth (Baessler Archiv, VI, 1-2, 1916-1917), 'amana, aman, amaˀ (Tapirapé): rain; Nimuendaju (Zeitschrift für Ethnologie, XLVI, 1914), 'amaˀ (Lingua Géral): (chuva) rain.

of death, and it is possible to communicate with it through revelations and visions.

THEORY OF DEATH

761 775 [100] Death distinguishes between men on one hand, women and children on the other. When they die, the former are transformed into jaguars who represent, consequently, so many reincarnated humans. The women and children, on the other hand, disappear with the wind and the storm and are not susceptible to any reappearance.

40. denõ dũrige ŋetnatũrina ẽdnadŋe lukuĩndige ndakuĩndige monãnkiadukuĩndige denõ dũrige monãŋe lĩttige amonotlĩttige tonodũrige ŋitẽndige (b1)
The woman and child who die do not change into beasts. The man who dies is changed into a jaguar, the woman who dies goes away with the tempest disappears with the storm.

262 Whence, among the Nambikwara, the only perfectly clear prohibition concerning food. Theoretically several exist, broken each time that the occasion is presented, such as those concerning the hawk, the worms from the bacaiuva nuts, and there may be added a probable repugnance concerning the meat of the veado (Cervus sp.). Chickens and dogs are never eaten, but their introduction is recent. [224 281 714] On the other hand, the jaguar can be hunted and killed, and its remains are highly regarded since the hide is used to make the fur bonnets worn in the attire of war; but it is not eaten under any pretext:

41. [following preceding text] loukuĩndige inkãra uĩrige lotãtãrige ikuitãdige ŋĩrige (b1)
775 [the dead man] becomes a jaguar, another eats him, the jaguar carries him off, he is left to another in order to eat him.

This theory complements the information collected in the eastern group more than it differs from it. The jaguar in fact plays the same rôle as the atãsu, it also carries off the dying. But the central theory adds a complement. This is that the deceased is identified with the animal, who thus becomes a supernatural being. It was not possible to find out if the atãsu which one meets at night are considered to be the souls of reincarnated dead people. (1)

776 171 1. One recognizes in the man-eating jaguar gifted with a supernatural nature a typically Tupi theme, although its present diffusion is much greater. See concerning this subject, Métraux, loc. cit., passim.

SP17 Nambicuara SP17

BURIAL

763 When it is seen that a person is about to die the women wail for a while and then they all turn their backs to the dying person and begin to divide up his belongings. The corpse is buried in a grave dug in the village or camp site. The men loosen the soil with sticks and scoop out the soil with gourds until a roughly rectangular grave about 5 feet deep is dug. The men who lower the body into the grave take three balls of soil from the bottom of the grave with which they rub their legs and backs. A man's decorations are placed in the grave with him. In the case of a woman, two or three gourds are placed at her feet. The grave is then covered. A man's bow and arrows are broken and left on the grave. The rest of his belongings are burnt nearby and the people go on a hunt for a few days. A bit of buriti fiber is left to mark the grave of a boy, although nothing appears to be left over the grave of a woman or a girl.

764

775 The ghost remains around the grave for several days and then goes to the sacred mountain where all the ghosts live. In the land of the dead the ghosts have fine necklaces, and nose feathers, and are always painted with urucú. But they do not wish to be forgotten and want the living to give them food. The Nambicuara do not fear ghosts, and like to have them participate in their ceremonies.

764 Two days before we left Utiarity, Marciano died. He was one of our best informants, the least morose and most helpful. A week earlier he caught cold which turned into pneumonia. It was pitiful to watch this naked man lying in the dirt beside a fire slowly gasping out his life. Once in a while he became conscious and tried to sing, calling the spirits to help him. About 9:30 that night he died. As there is something symbolic in his death and burial I would like to end this account of the Nambicuara with an entry from my diary dated July 30, 1949.

This morning we all went to the burial, the Jesuit priests, the Protestant missionaries, some of the Brasilians, and Kaoro and I. We dug a grave at an old Nambicuara camp site about a half a mile from Utiarity. As we walked along the telegraph line bearing Marciano's body the cabá were singing and the air was full of the sweet odor of the timbó vine. Wrapped in a ragged blanket Marciano was lowered into his grave along with his

[p. 104 (2)]

601 35. tarũtarosu : "old brother-in-law" (tarũte [b 1/2] equals asũkosu [a 1/2]);

36. tuĩrarosu : "old husband" (ũĩte [b 1/2] equals ouẽnsaesu [a 1/2]);

37. ianẽrosu : ?

38. asoũkerosu : "old grandfather" or "father-in-law";

[25] 39. takaʔkenosu cited with the commentary : "When the
●[764] takaʔkenosu dies, the alõnsu cut their hair, but not the akenãnosu."

Finally, two terms of relationship express the relations coming from "oblique" marriages and from the division of generations into "elders" and "younger":

40. ajũnkedisu;

41. (t)ãdirikisu.

A man calls the akenanosu of his mother ajũnkedisu (while the term asoũnosu is generally—but not always—reserved for the alõnsu); one and the other are, of course, the asũkosu of his father. The same individual is then called "father-in-law" (asoũnosu) or "husband" (ouẽnsaesu) by the sister of the subject considered, or, if she is married, ajũnkedisu also, the husband then calling him "father" (ahuĩnosu). One sees then that the ajũnkedisu is a man whose daughter or wife I (masculine subject) marry, and whose son my sister marries, if she does not marry the man himself. Thus it is explained that the ajũnkedisu is asũkosu or asoũnosu, to my brother; asũkosu or asineẽru, to my father; akenãnosu or asineẽru, to my mother; ouẽnsaesu or asoũnosu, to my sister; ahuĩnosu, to my wife.

On the other hand, a man calls a woman (t)ãdirikisu who can be arĩndesu or asintu of his father, aseẽtasu or asĩntu of his mother, aseẽtasu or aʔẽnosu of his sister, aekẽnosu of his wife. She is then a woman whom I marry or whose daughter I marry. A woman, in her turn, calls another woman (t)ãdirikisu who is aʔkẽndesu of her husband, that is, a woman whose brother or son she marries.

601 582 One sees that these two names bestow two privileges, or opens a double right: that of the marriage of the mother's brother (and, theoretically, of the father's brother) with his niece; a right belonging essentially to the elder brother; and of the marriage of the sister's son (brother's son) with his aunt. This rule, or rather this possibility is explained on the one hand by the tendency of the Nambikwara towards polygamy, on the other hand, by the scarcity (moreover consecutive) of women. We shall study examples in an instant.

684 626 [182] conscious function the bringing of psychological compensations incommensurable among themselves, rather than for establishing equivalences of value.

●764 184 The Nambikwara have two types of burial. The eastern groups practice double interment. The bodies are first placed in a crouching position (ãriuaerekititu, a1) in a circular ditch (sinitakurisu, a1) seven feet deep heaped up with earth and branches. For two months, they sing, dance and weep around this provisional tomb, until the body is decomposed. Then the bones are carried to the river where they are carefully washed. Then they are carried in [768] a cloth to be permanently buried in the village. The village is then abandoned, but the site is often visited:

53. auregande aŝunikere kadukarage iaudrige ende ende ende inare inaretaire ŝinoribate (b1)
to dig the grave, to close it, to wait one moon, one moon, one moon, to take out the bones, to bury them in the village.

In the central groups, on the other hand, the bodies would be buried (aoʔenikere, b1) in a prone position (iotarige, b1).

The funeral rites distinguish between movable goods and immovable goods. The first are carefully destroyed; they break and burn the weapons; they unravel the beads and necklaces.

[768] The garden of the dead man, if he cultivated one, is, however, only abandoned, and can be reclaimed later:

54. doŝore dutige adrede autadatige audotahãmdige audotaãmde odenehẽire odunhinde njaotumnie narainidande naraidutige aiiredugejottige den den den nagiaode aire dugiotige tiatugiotige (b1)
The arrows are broken, everything must be broken the beads are unstrung, the beads of the deceased, the fields of the deceased are abandoned one moon, one moon, one moon, and when all is forgotten, another takes the field.

423 Yet it is necessary to avoid confusion on this point. Strictly speaking, there is no land property among the Nambikwara. The chief invites his men to group together to cultivate the gardens, but sometimes such and such an individual decides to clear a field on his own account. These personal appropriations do not give rise to any incidents since the cultivatable land is usually far larger than the collective needs. However, a garden represents a value, because of the considerable amount of work spent in clearing it, especially for people who have never seen metal tools until 30 years ago. Also the rule of destruction of the goods of the deceased respects the

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

tainship is not hereditary; the chief, when old or sick, designates his successor from the ablest men of the group. The chief's authority is slight; it depends wholly on the good will of the family heads. 622

Relations between neighboring bands are inspired both by fear and by the desire to exchange goods. Warfare, therefore, is closely connected with barter. Groups not acquainted with each other use ritual speech when they meet. 619 438

Before starting a war expedition, a divinatory rite is performed with special songs and dances. An arrow is hidden by the shaman, the outcome of the expedition being pressaged by its appearance the following day. 721 787

LIFE CYCLE

Childbirth.—After the delivery of a child, the placenta is buried in the bush and both parents are subjected to rigid prohibitions concerning food, the use of ornaments, and social contacts. 844

Puberty.—The initiation rite for young men consists of piercing their lips and nose and giving them their adult personal name. At her first menstruation, a girl is isolated for several months in a special shelter outside the village, where she is given ritual food by her mother. At the end of the rite, she takes a long bath in the river; this also constitutes the first step of the marriage ceremony. 881 [304]

Both cross-cousin and avuncular marriages (see p. 367), are often planned by parents for their infant children. Marriage is celebrated by festivals, banquets, and dances. The union is pronounced by the chief. Fish and fishing are important both before and during the ceremony. 584 585

Separation is frequent, the chief cause being that the man seeks a younger and prettier woman. There is no social sanction of adultery, except that the seducer is advised by his companion to go away for a while so as to avoid the husband's revenge. A murderer also flees vengeance. 586 684 682

Death.—Some groups of *Nambicuara* bury their dead in a circular pit, the corpse being placed in a crouching position. Others leave the corpse to decompose in an elongated ditch and later wash the bones in the river, put them in a basket, and bury them in the village, which is then abandoned. Weapons, implements, adornments, and other property of the deceased are destroyed, but his garden—if he owned one—is abandoned only for a few months. Later anybody may cultivate it. 764

ESTHETIC AND RECREATIONAL ACTIVITIES

Art.—Most *Nambicuara* groups are completely ignorant of drawing, although some groups decorate calabashes with dots and straight and sinuous lines. These are conventionalized reproductions of realistic designs found among other groups. 531

648 only work for the white man when they want an ax, a knife, a gun, or some article of clothing, and once they obtain what they want they wander off. Miners particularly are bitter about the fact that the Nambicuara are unreliable workers.

797 Missionary activity, which has been carried on intensively by both Protestants and Catholics for about 20 years, has been singularly unsuccessful in Christianizing the Nambicuara. The Jesuit priests informed me that only those individuals who have been taken to Diamantino as children and kept there can be said to understand the rudiments of Christianity. The hope is that eventually these individuals can be brought back to the tribe and through their influence their children will be raised as Christians. The Protestants tell the same story. The Indians remain around the mission stations, participate in prayer meetings, and perform little tasks for which they are compensated but they soon become bored and wander off. The Rev. L. W. Buckman told me that he raised a Nambicuara boy at the station and believed that he would remain, but one day the boy got married, left with his wife, and took up the old wandering pagan form of life. None of the Wakítisu band are considered Christians. When Marciano died [764] a few days before I left he was buried according to Indian custom, both Protestant and Catholic missionaries participating in the burial as onlookers. Among this band which has had as much missionary contact as any, there was not a single individual who could speak or read Portuguese. Some of the men, as has been mentioned, used a form of pidgin Portuguese as a means of communicating with their white neighbors.

648 The attitude of the Nambicuara toward the white man is not only one of suspicion and sullen resentment, but one of disdain. They call white people "civilisados" or sometimes "bean eaters." A Nambicuara feels insulted if these terms are applied to himself. He openly boasts of being a "bugre," a slang term widely applied to Indians in Brazil which signifies a sodomite or heathen. While all other Indians that I have met in Mato Grosso objected to this term when it was applied to them, the Nambicuara always use it when talking about themselves. Julio informed me that the Nambicuara always get sick when they visit white people. The missionaries confirmed this fact but added that the Nambicuara have now become

The chief admon-
ishes quarrelsome individuals but appears to have no powers of coercion. The Wakítisu claim that individuals quarrel but they do not fight among themselves nor do they remember any cases of murder. Unwanted individuals are exiled by common agreement. Houses, fields, and some implements are common property, and food is shared among the members of the band. Axes, machetes, and knives, although owned by individuals are freely used by other members. At death, privately owned tools pass to a man's sons or to his brother. The bow is customarily broken and left on the grave. Even these rules are not strictly adhered to, for when a man becomes seriously ill other men begin to help themselves to his property and the one with the "strongest mouth" gets the most. If the man recovers he cannot reclaim his things but must set about accumulating a new supply.

The wife and the children are under the strict control of the husband. Although boys must obey their fathers they owe no special obedience to their mothers. Boys sometimes throw stones and sticks at their mothers and the old women; the older men not only laugh but even encourage this disobedience. The bond between brothers is very close. On occasion they share each other's wives. No particular respect is paid to in-laws.

RELIGIOUS BELIEFS AND PRACTICES

According to the Wakítisu the spirits are the source of all danger, misfortune, sickness, and death. The ghosts of the dead (*ayánkadisu*), bring sickness unless offerings of food are made to them. The ghosts of dead shamans (*anúnsu*), belonging to other bands bring thunderstorms which destroy gardens and make hunting difficult. In addition to the ghosts, there is *tauptú*, the hawk of death who lives in the sky, and *ulurú*, the evil armadillo who lives under the ground and wants to destroy the villages and camps of the Nambicuara.

Tauptú is an enormous hawk with huge wings, tail, and claws, who sits in a tree made of human bones. This tree (*lálukatsu*) is situated on the shore of a shallow lake in the sky. Shooting stars are caused by *tauptú* defecating at night. A small red bird (*dinínuwa*), who lives with *tauptú*, urinates into the lake and when it fills up the urine overflows and comes down in the form of rain.

764 necklace and a few rusty cans, the grave was covered, and there we left him a few feet from the grave of his first wife who had died in the measles epidemic four years before. Then Julio, the chief, told all his people to gather around the grave and as he walked around it he told Marciano that here he had water and sunshine, and that after a few days he would be with the ancestors around

[p. 105 (A)]

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

764 the stone mountain at Juruena. The white men had not a word to say. It seemed that we were not burying just an Indian but a race, older and more simple in its way of life than its Arawak- and Carib-speaking neighbors. And the telegraph line beneath which Marciano rests is the symbol of all those forces which destroyed him and are slowly destroying his brothers.

542 treated with great affection. The men are jealous of their wives, and
[837] the women take pride in being faithful. In this respect they are quite unlike their neighbors, the Paressi women...

832 The couples are always petting each other, and no caress seems
302 sweeter and more tender to the lover than the woman's fingers running through his hair. This is easy to understand, for the Nambicuara head swarms with vermin...

[Fig. 38]

585 According to reports of the soldier Gouveia, marriage is a simple ceremony. The man asks the father of his beloved for consent to the union. If the father agrees, he gives the bridegroom a bow and a sheaf of arrows, telling him that with these weapons he must support the family he is about to form. That is all.

851 To show that a boy is the son of a certain man, they use in
201 their innocence an expressive gesture: they join the thumb and index finger of the left hand, in the shape of a ring, around the right extended index finger. Then they tap the child and father on the shoulder, saying "Uétü!" (son).

888 They show great respect for old people and spare them all possible effort. When we returned from the village on the Urutau to the post on the Juina, they had us carry [258] on the bow of our saddles the baskets of two old men from the group that accompanied us in search of gifts. The young men and the women all carried their own atiçú and did not ask for help.

771 As to their religion, we know only that it is fetishistic. We know nothing of its cult or system, and even less of its dogma. [Fig. 33]

821 The northern groups seem to be tending toward astrolatry. Once
[771] when I had threatened the moon and the stars with an arrow, poised ready on a strung bow, several Tagnani rose abruptly and halted my gesture, speaking very excitedly, scolding me, and taking the weapon away from me as if it were a sacrilege.

The Cocozu and Anunze threaten the storm with their weapons, waving their arms in all directions and cursing the rain in loud yells.

Sometimes, instead, the women climb on a termite nest where they let out puffs of smoke and throw ashes into the air to frighten the storm.

764 We do not know anything as yet about their funeral rites. It has been ascertained, however, that they do not cremate their dead and do not eat them. They bury them directly [259] in the ground--
the Cocoza in circular pits, the Tagnani in elongated graves.

4: Oberg E-5 (1949) 1953
SP17 Nambicuara SP17

subsistence activities. For instance, they say that they eat the blossoms of certain plants and a great number of grubs, larvae, and insects. A favorite dish is to crush in a mortar manioc cakes with boiled beans, broiled meat, ants, palm nuts, monkey and bird bones.

As an example of the variety of uses to which the Nambicuara can put a plant we can take the buriti palm: (1) They eat the pulp surrounding the scaly covered nut. (2) They use the fibers from the new growth to make twine. (3) They use the tough, flexible cortex of the frond stalk for making baskets. (4) They fell the buriti so that a certain variety of grub can collect and multiply in the starchy pith in the heart of the tree. The grubs or larvae they then eat uncooked. (5) The dried frond stalks are tied into bundles and used as floats for crossing rivers. In addition, the buriti palm has male associations, for only men can prepare its products. When a male child dies a piece of buriti fiber is left over his grave.

The Nambicuara make fire by the drill method. They cut two round pieces of dry stick about 18 inches in length and three-quarters of an inch in diameter from some bush that has a soft pithy center. The lower stick is split and into the flat side shallow notches are cut to hold the drill in place. The drilling stick is then inserted into the notch while the lower stick is held in place by the toes of the man as he squats over it. He then begins to twirl the stick between his palms, pressing downward. As his hands reach the bottom, he quickly brings them to the top and continues drilling until the pith in the lower stick loosens into small smouldering balls. These he places into a handful of dry buriti fiber and begins to blow on them until the fiber ignites. About 2 minutes is all that is required to make a fire by this method.

MANUFACTURING

The material equipment of the Eastern Nambicuara is extremely simple. Many items, such as the conical trap for catching fish, the floats for crossing rivers, the loom for weaving arm bands, and the mortar and pestle for crushing food products are made for the occasion and are discarded when the task is completed or when the people move. The small grater and the few gourd vessels, small baskets, and twine, the woman carries

[p. 92(B)]

601 husbands or wives, or of the true father or mother compared to the theoretical "fathers" or "mothers," or of true sons or daughters as compared to theoretical "sons" and "daughters." In most cases, the discrimination seems totally superfluous to the Indians, since it is so well accented by the differences of behavior. Sometimes also it seems useless because of the inverse of the preceding, the theoretical wife can become a real wife (for example in case of polygamy, or of remarriage), the theoretical father or mother, or the theoretical son [608] or daughter, can play the role of true father or mother, or of true son or daughter, through the mechanism of adoption. This functions automatically, in the case of the father's death, the child then being [22] [768] taken in and raised by its father's brother. In this case his father's brother, whom he has always called father, becomes for him a real father even though by substitution, and the wife of his father's brother, who is most often his mother's sister, and whom he has consequently always called mother, is from then on treated by him as such, especially if his own mother is dead or has remarried. However, sometimes the Indians wish to sharpen the theoretical character of the name. Then they add to the classifying term a descriptive term, whose approximate meaning is that of "relative" in the most general sense, as,

20. (akit) a'dnisu,

used in the substantive form above, or in the participial form a'dnere; or in the exclamatory form, in conversation, a'dneram.

Thus we have found the following appelations,

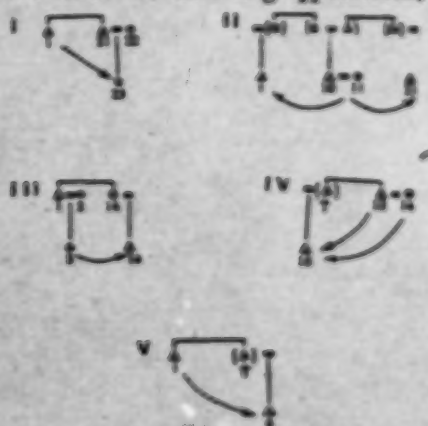

Fig. 3

I. a'kineru a'dneram. --II. (t)oyensaesu a'dnisu. III. oyensaesu a'dnisu (among children). IV. tayettu a'kiraru a'dneram. --V. akineram (a'kirare a'dneram).

601 are found which complete (or substitute for) the classifying terms a2e'inosu, asoinosu, ahuinosu, a2ke'nosu:

27. arindagresu : "mother's mother";
28. oyensserosu : "mother's father";
29. aseetagresu : "father's mother";
30. aldinarusu : "father's father";
31. a2e'ndagresu : "sister of the mother's mother."

The etymology of the terms verifies the principal of marriage of cross-cousins. In fact, if one has:

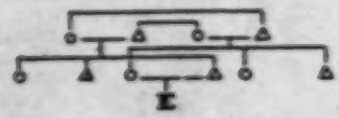

Fig. 4.

it is established that:

arindagresu (or arindakerosu, "little old sister"), is the sister of my father's father;

oyensserosu (from oyensaesu, "husband") is the husband of my mother's mother;

aseetagresu (or aseetakerosu, "old sister-in-law") is the sister-in-law of my mother's mother;

aldinarusu (from aldusu, "brother") is the brother of my mother's mother.

Concerning uncles and aunts, their name is sharpened by descriptive terms:

32. aka'ntagresu, atakarusu: "mother's sister";
33. akaterosu : "mother's brother";
34. aya'dnosu : "father's sister."

No descriptive term has been found for the father's brother, normally called father (ahuinosu); perhaps this lack is to be explained by his position as father in case of the blood father's death.

[760]

On the other hand, the following descriptive terms have been collected in the course of attempts at geneological reconstructions, but it was not possible to determine for certain the levels or degrees of parentage to which they refer. It is possible that they are employed jointly with certain of the preceding terms:

conscious function the bringing of psychological compensations incommensurable among themselves, rather than for establishing equivalences of value.

The Nambikwara have two types of burial. The eastern groups practice double interment. The bodies are first placed in a crouching position (ãriuaerekitiu, al) in a circular ditch (sinitakuritu, al) seven feet deep heaped up with earth and branches. For two months, they sing, dance and weep around this provisional tomb, until the body is decomposed. Then the bones are carried to the river where they are carefully washed. Then they are carried in a cloth to be permanently buried in the village. The village is then abandoned, but the site is often visited:

53. ayregande aũnikere kadukirage iaxtige ende ende ende inare inaretaire sinoribate (bl)
to dig the grave, to close it, to wait one moon, one moon, one moon, to take out the bones, to bury them in the village.

In the central groups, on the other hand, the bodies would be buried (aoẽnkere, bl) in a prone position (iõtarige, bl).

The funeral rites distinguish between movable goods and immovable goods. The first are carefully destroyed; they break and burn the weapons; they unravel the beads and necklaces.

The garden of the dead man, if he cultivated one, is, however, only abandoned, and can be reclaimed later:

54. doõre dutige adede aitadatige audotahãmdige audotaãmde odenebeire odunhinde niactumnie narainidande naradutige afredugeiõtige den den den nagiaode aire dugiotige tiatugiõtige (bl)
The arrows are broken, everything must be broken the beads are unstrung, the beads of the deceased, the fields of the deceased are abandoned one moon, one moon, one moon, and when all is forgotten, another takes the field.

Yet it is necessary to avoid confusion on this point. Strictly speaking, there is no land property among the Nambikwara. The chief invites his men to group together to cultivate the gardens, but sometimes such and such an individual decides to clear a field on his own account. These personal appropriations do not give rise to any incidents since the cultivatable land is usually far larger than the collective needs. However, a garden represents a value, because of the considerable amount of work spent in clearing it, especially for people who have never seen metal tools until 30 years ago. Also the rule of destruction of the goods of the deceased respects the

621 Eléitaru band. This is the custom among all the Eastern Nambicuara bands.

601 The kinship terminology belongs to the bifurcate merging type. The term *tapidaiuru* (grandfather) and the term *quatakitiriru* (grandmother) are extended to the brothers and sisters of one's grandparents. The term *ouiniru* (father) and the term *akakitiriru* (mother) are extended to father's brother and mother's sister, respectively. Father's sister is termed *akaiwaru* and mother's brother *ouiwaru*. A man calls his older brother *akwadiwaru*, his younger brother *dwadidiriru*, and his sisters *ewadiwaru*, these terms being extended to parallel cousins. The terms for son (*akiriru*) and daughter (*akwairu*) are extended to the children of a man whom ego calls brother. The terms for sister's son and daughter are *ouatu* and *oeiatu*, respectively, these terms being extended to the children of anyone whom ego calls sister. The term for male cross cousin is *aeikiriru* and that for female cross cousin, *dwairu*. There is just one term for grandchildren, *quatadiawaru*.

The only affinal kinship terms which we could obtain were the terms wife (*aaiwa*) which bears a close relationship to female cross cousin; husband (*ewaairu*); and the terms for father-in-law (*aeiwaru*), and mother-in-law (*akaiwaru*), which are identical to the terms for mother's brother and father's sister. Whether women employ different kinship terms was not ascertained owing to the fact that the women refused to discuss the matter and the male informants persisted in going to sleep when the subject was broached.

582 The kinship terminology supports the statement made by the Nambicuara that cross-cousin marriage is preferred. Excepting one Eléitaru woman all the wives in Julio's band were Wakitiriu and cross cousins of their husbands. At the death of

587 the husband the wife and children pass to the

● 768 deceased husband's brother. Women sometimes marry their mother's brothers. Residence is patri-

591 local although when marrying a woman from another band, the man sometimes remains with his wife's band for a while. Band membership, as has been stated, is determined by matrilineal descent.

622 The powers of the chief are limited to leadership in such activities as hunting, planting, trade, and ceremonies. Raids, although organized by the chief, are not led by him. The chief admon-

361 [226] We do not know yet what determines these shifts to nearby locations; they may perhaps be caused by the death of an
[76] Indian or by some communal misfortune. The distances involved are so small that the moves could not possibly derive from any significant ecological changes.

362 In order to keep rain water from seeping underneath the thatch, the Tagnani and Tawite Indians cover the inner ground perimeter of their conical huts with a series of overlapping plates made of jatobá shells.

The rain does not leak in.

354 It would not be fair to imagine the interior of the huts as hot and stuffy; air penetrates freely in between the leaves.

Nevertheless, the situation changes when the Indians light their small fires. Happily for them, the thatch is sufficiently permeable to keep their eyes free from the grave diseases often encountered among primitive peoples whose dwellings are smoky.

362 Household furnishings are rudimentary; except for the grids mentioned above and a few large pots, nothing else might properly be
[84] termed a piece of furniture. All other objects are tools, artifacts, weapons and ornaments [227] [plates p. 222] which they carry with them on every journey, no matter how brief. Only the heavier mortars and graters, which cannot be carried easily, are left in the hut. These barbarians in turn could say: "Omnia mea mecum porto" [everything that is mine I carry with me].

Straw pallets, cured hides, hammocks, sleeping platforms, cots and true beds represent types of bedding characteristic of different stages of civilization.

513 The use of pallets already indicates a certain degree of advancement; but the Nambicuara have no bed other than the earth. They sleep on the bare ground.

They did not possess the hammock, that inseparable companion of their neighbors the Paressi; now that they are acquainted with it, they hold it in high regard. It was difficult to obtain any rest among them during the night; no sooner had we set up our hammock than three or four candidates would appear... And once they had taken over, it was hard to get it back. We were frequently awakened by Indians who forcibly asserted their desire to sleep in the hammocks we occupied.

721 Excitement and enthusiasm decline, and the group returns home.
But some are pushed until realized, [95] and can be very murderous.
726 The Nambikwara usually attack at dawn and extend their ambush by
dispersing throughout the bush. The signal for attack is given from
[534 203] place to place, thanks to the whistle which the Indians carry hanging
from their necks. This little whistle, composed of two bamboo tubes
[136] tied with cotton thread reproduces the cry of the cricket approximately,
and doubtless for that reason has the same name (kalõde) as this insect.

MAGIC, RITES AND RELIGIOUS BELIEFS

278 Some beliefs of a magical and religious character also play
[771] their role in social life. The most important is the notion of
nãnde (bl). To analyze it, we should first say a few words con-
cerning poisons. The Nambikwara are very expert poisoners. They
make curare for their arrows, or at least for some of them, pre-
[415] served in little earthen pots. (1) Without enlarging here upon the

1. The study of the Nambikwara curare was made, on the occasion of our expedition, by our friend and companion Dr. J. A. Vellard. Cf. Vellard, "A preparação do curare pelos Nambikwaras," Revista do Archivo Municipal de São Paulo, LIX, 1939, p. 5-16; "Communication à l'Académie de Médicine de Paris," id. LVIII, 1931, p. 117-118.

manufacture of the curare, it must be noted that this preparation, although reserved for chiefs and sorcerers, is not surrounded by any ritual and does not give rise to any magical operation. The Indians make the curare publicly, applying recipes and taking precautions which are either essential to the effectiveness of the product or which constitute simple prejudices, but all of which have a positive character. Their attitude towards this poison thus may be considered as scientific. Along with curare, the Nambikwara know other poisons likewise of vegetable origin, and which take the form of powders
[415] contained in small tubes. These are made of quills, feathers, or stalks of bamboo or other wood, cleaned out and corked at both ends with a piece of vegetable pith or cotton, and at times decorated with red dots and lines made with urucu paste. (2) These tubes are

2. Cf. Rondonia. Roquette Pinto collected examples of these tubes and reproduced one of them (Rondonia,

789 411 [b1], makalé [c1]). This instrument is used in three circumstances: in war; to conjure up (or to attract?) rain by manipulating it according to an approved ritual as if one were tracing signs in the air while brandishing it; finally to kill the atáisu, by throwing it in the direction of the apparition, using as intermediary a tooth of the jaguar; the throwing stick is placed obliquely in the left hand, the point turned in the direction of the atáisu, and the tooth, manipulated by the right hand, acts as a hook for projection. The atáisu appears only at night. It may borrow the form of the jaguar or of other animals who are then filled with murderous intentions. When the atáisu is caught in his terrestrial form at the point of the javelin, a great flow of blood is produced. The "supernatural" animal is never eaten. They abandon its body to the carrion.

789 761 In the second case, one is faced with a real theory of death. The sick person who sees the atáisu appear knows that he is condemned, and the animal actually carries him off on the spot or returns to get him a little later. The current version of the death of A21, drowned in a river in July 1938, was that the atáisu carried him to the bottom of the waters. The atáisu would live in the water. An informant described it as having "a large mouth and lots of collars."

789 771 761 The southern, central and northern groups bear witness to a more elaborate religious thought. Among these peoples, the preceding notions are crowned by a third, which does not appear as clearly in the eastern groups although it is probably present, that of the wind and thunder, hypostasized in the forms of a semi-personal power named amõ. (1) In these groups, this is substituted for the atáisu in the theory

1. The Tupi origin of this term is evident. One can compare Montoya, "amaː cloud of waters; Nogueira, "amaː cloud; Coudreau (Bibliothèque Linguistique Américaine, XV, 1892), "amane (Oyampi): rain; Gonçalves Diaz, "amanaː (chuva) rain; Kinenberth (Baessler Archiv, VI, 1-2, 1916-1917), "amana, aman, amaⁿ (Tapirapé): rain; Nimuendaju (Zeitschrift für Ethnologie, XLVI, 1914), "amaⁿ (Lingua Géral): (chuva) rain.

of death, and it is possible to communicate with it through revelations and visions.

787 These visions are attributed to the thunder which sends them to men under its semi-personal form amõ.

●771 Thus the Nambikwara conceive of three types of supernatural
756 forces: first the power which is abstract, but placed in objects or substances, the nãnde; next the spirits acting in the form of supernatural or seminatural animals, atásu or jaguar. Finally the thunder, with which under certain conditions, it is possible to entertain personal relations. Each individual can, in a certain measure, establish contact with these forces, however it is the shamans who have the specialized function of intermediary between the human group and the supernatural world. The information which we shall give on this point will be very summary, for it was impossible to obtain from our informants a coherent treatment of the question of shamanism. None of the groups encountered had a shaman with the exception of a single one (group c) where the powers of the chief and the sorcerer were found [102] concentrated in a single individual (C20). Our best informant, B1, chief of the allied group, was categorical concerning the fact that C20 combined the two qualities of nelikabala (chief, c) and of ndãre (thunder, c) although he was only nilikãde, temporal chief. The sorcerer would then be simultaneously the man who identifies himself with thunder, and who communicates with it in the personal form called amõ. Likewise, in the eastern groups (a1 restricted and enlarged, and a2), it was not possible to uncover the presence of a sorcerer or of an individual with such powers. This fact could be interpreted in three different ways: that the sorcerers were held apart; or that they dissimulated their nature; that the institution of the sorcerer is, in fact, absent in certain groups; or that, in these same groups, the functions of the sorcerer are exercised by the chief, and that, in inverse fashion to what is produced in group c, it is the spiritual functions which are in second place with regard to the temporal. It is this hypothesis which we consider the most reasonable. In group a1; A1 makes the arrow poison and treats sick persons by suction, functions which in group c come within the province of C20 considered as shaman, rather than chief of the group.

756 Whatever the fact may be, and as we have just said, it is the sorcerer who makes the poisons, and it is he who proceeds to the magical treatment of the sick, clearly different from the positive
278 therapeutics likewise practiced. The Nambikwara are familiar with
757 quite a large number of medicinal plants and treat certain illnesses with their help. Thus they care for purulent ophthalmia by an

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

533 **Music and dance.**—Music is clearly tonal, with melodic structures easy to identify. The end of a melody is usually marked with several shrill sounds which are repeated after each coda. Music is both instrumental and choral and usually accompanies dances.

535 Dances are performed under the leadership of the chief. Men and women stamp rhythmically on the ground while turning in a circle. Usually, dancers close one nostril with the left hand to make their singing nasal. Only men perform war dances, forming one or more rows and stepping forward and backward in front of the leader. In the second phase of the dance, they attack a post, a symbolical enemy, with bows and arrows, and clubs. Most of the dances and songs are connected with hunting or seasonal ceremonies, but they may be used at any time for mere entertainment.

534 **Musical instruments.**—Flageolets have four holes and an air duct; three are usually played together, accompanied by a rhythm trumpet made of a piece of bamboo with a hollow calabash fixed to its bottom. Nose flutes (pl. 36, *top, right*) are made of two pieces of calabash glued together with wax and pierced with three holes. One hole is blown with one nostril while the other nostril is closed with the thumb; the other two holes vary the notes. Nose flutes are also played in unison. Double and treble whistles have the air duct cut in the middle of the pipe, so that they can be blown at either end. Panpipes (pl. 36, *bottom, left*) are of two kinds: the common type has five pipes; the other type consists of two or three reeds cut obliquely at the mouth-end. All pipes produce approximately the same note in the latter.

272 273 **Drinks and narcotics.**—Drinks are made with crushed manioc or maize mixed with water, or of palm fruits, especially *Mauritia* sp., *Acrocomia* sp., and *Oenocarpus distichus*. A slightly alcoholic beverage is prepared of wild pineapples mixed with water.

276 The *Nambicuara* are ardent smokers. They cultivate a tobacco with tiny leaves, which they dry between two pieces of wood, crush with their hands, and store in small calabashes. Cigarettes are rolled in special leaves and tied with grass.

MAGIC AND RELIGION

771 The *Nambicuara* believe in the existence of a diffuse power or substance which may occur in objects and in living beings. It is manifest mostly in poisons, some of which are real (see Weapons, p. 366), some purely magical. To the latter belongs the rosin of the barrigudo tree (a Bombacaceae), which is kept in tubes like the true poisons. When thrown by a special technique at an enemy, it is believed to make him swell like the trunk of the tree and die.

776 There are also dangerous spirits of the bush and of water, which may appear in the shape of an animal, especially the jaguar, or in a

534 *kadínau*, the nose flute, *maittánau*, and the five-tube panpipe, *dútu*. The nose flute which is about 4 inches in diameter is made by sticking two round pieces of gourd together with rosin. Three holes are made on one side, two holes providing finger stops, while air from one nostril is blown across the other. These flutes do not appear to have any ritual significance.

771 In reviewing the religious symbolism of the Nambicuara it appears that the following conclusions can be drawn. The *okilidilies* myth explains the origin of the Eastern Nambicuara and their rights to the territory which they now occupy. *Tsuptá*, although not the cause of illness, explains why people die. *Tsuptá* and *dilsínaus* also account for the existence of shooting stars and the presence of rain. *Ulurá* appears to represent the ever-present forces of destruction inherent in the physical environment. Within the framework of these ultimate forces the Nambicuara carry on their struggle for existence assisted by and opposed by the members of their own kind. The security of the band depends upon the close cooperation of the kinsman acting under the guidance of the chief. The *wdiarku* flutes provide a supernatural sanction for the powers of the chief and thus help in enforcing and maintaining band solidarity. The flutes, furthermore, are a symbol of the common ancestry of the Eastern Nambicuara in that they relate the bands to the culture hero. The ghosts of the ancestors (*aydnkadies*), like the living members of the band, must be well-treated in order to avoid danger to children and the perpetuation of the band.

619 But actual day-to-day danger to the individual comes from the members of other bands. Disputes over women and quarrels arising from the exchange of goods, as we have seen, lead to bloodshed and death. In the ultimate analysis each [621] band defends itself as a sovereign unit by force. The danger arising from the constant tension and suspicion between the bands is symbolized by the *enánau* who bring illness, who create the storms which destroy the houses and fields, and who threaten the band with starvation by making hunting difficult. As direct attack by other bands is met with the physical forces of the band, so spiritual attack by the *enánau* of other bands is met by the assistance of one's own *enánau*. They help the shamans to draw out the evil objects

542 treated with great affection. The men are jealous of their wives, and
[837] the women take pride in being faithful. In this respect they are quite unlike their neighbors, the Paressi women...

832 The couples are always petting each other, and no caress seems
302 sweeter and more tender to the lover than the woman's fingers running through his hair. This is easy to understand, for the Nambicuara head swarms with vermin...

[Fig. 38]

585 According to reports of the soldier Gouveia, marriage is a simple ceremony. The man asks the father of his beloved for consent to the union. If the father agrees, he gives the bridegroom a bow and a sheaf of arrows, telling him that with these weapons he must support the family he is about to form. That is all.

851 To show that a boy is the son of a certain man, they use in
201 their innocence an expressive gesture: they join the thumb and index finger of the left hand, in the shape of a ring, around the right extended index finger. Then they tap the child and father on the shoulder, saying "Uétü!" (son).

888 They show great respect for old people and spare them all possible effort. When we returned from the village on the Urutau to the post on the Juina, they had us carry [258] on the bow of our saddles the baskets of two old men from the group that accompanied us in search of gifts. The young men and the women all carried their own aricú and did not ask for help.

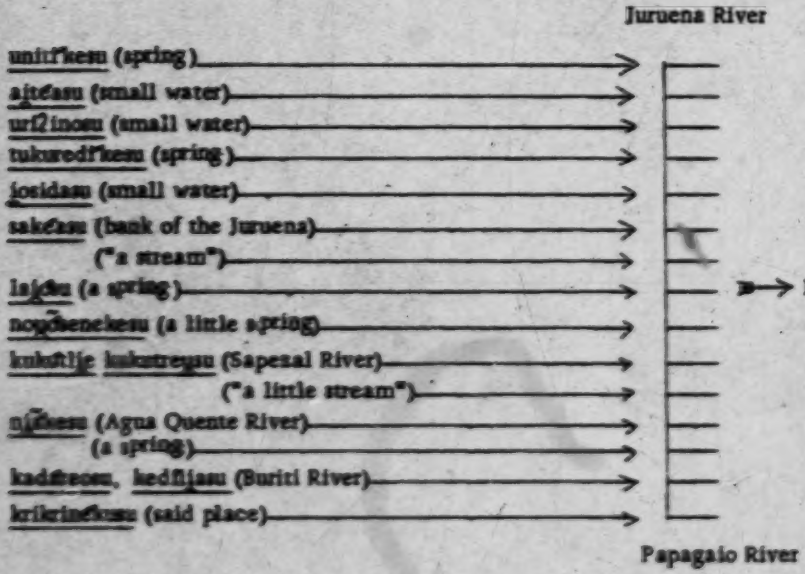
● 771 As to their religion, we know only that it is fetishistic. We know nothing of its cult or system, and even less of its dogma. [Fig. 33]

821 The northern groups seem to be tending toward astrolatry. Once
[771] when I had threatened the moon and the stars with an arrow, poised ready on a strung bow, several Tagnani rose abruptly and halted my gesture, speaking very excitedly, scolding me, and taking the weapon away from me as if it were a sacrilege.

The Cocozu and Anunze threaten the storm with their weapons, waving their arms in all directions and cursing the rain in loud yells.

Sometimes, instead, the women climb on a termite nest where they let out puffs of smoke and throw ashes into the air to frighten the storm.

764 We do not know anything as yet about their funeral rites. It has been ascertained, however, that they do not cremate their dead and do not eat them. They bury them directly [259] in the ground--
the Cocoza in circular pits, the Tagnani in elongated graves.



TRADITION

The Nambikwara have a sharp sense of tradition. We have read 173
above (p. 50) a remark of B1 which shows him to be sadly cognizant of the decline of his race. Customs and techniques are generally considered as [183 329]
legacies of the "ancestors":

58. irɛ̃hore ikɛ̃tage uʔttige.
"The ancestors taught us how to coil it [the ribbon of rubber meant for making a ball]" (b1).

One single legend was found relating to the origin of the universe. [120] 773 539
It is that of the Flood, the childrens' version of which we have already given. (1) Here is the text used by adults:

1. See above, p. 69.

that a moon end that a moon end that a moon end
uatlitnjãni (b1)
in order that they arrive.

The whole story can be summed up as follows: alone of all the 773
humans, one old woman succeeded in escaping the Flood by hanging to the top of a buriti palm. By letting some nuts fall from the palm into the water, she was able to measure the decline of the water, and when the ground was dry, she came down and was delivered of a son. Through an incestuous union with her son, she then gave birth to twins of different sex, and from their incestuous union was born a new generation of twins. Thus, the whole of humanity would be descended from a series of marriages between twins, each giving birth to a new couple. As men multiplied, new villages were founded, always further away. So much so that today men live at such distances from one another that they do not speak the same language, do not understand one another, and must travel for whole months in order to visit.

This version offers several points in common with others collected in distant regions of South America. It is doubtless necessary to interpret the throwing of the palm nuts in the light of the "magical projection" 773
which has been studied above. (1) The throwing of small nuts certainly 171

1. Cf. p. 96.

possesses a magic significance. The same episode is found in several versions of the legend of the Flood, (2) and its magical value is formally attested

2. Cf. for example the Tupi version collected by Thevet, cited by Métraux, loc. cit., p. 45.

for the Ŝipaia by Nimuendaju. (3) In older versions, the old woman (since

3. To kill the sun by throwing upon it small nuts of the palm tree anaja, thus introducing night upon the earth ("Sagen der Tembe Indianern," Zeitschrift für Ethnologie, Vol. 47, 1915, p. 296).

In older versions, the old women (since
the old women share the magic powers of the men among the Nambikwara 773 171
as also in other tribes) (4) was undoubtedly not content with measuring the [789]

4. Cf. above, p. 101.

fall of water by the duration of the fall of her nuts, she actually provoked it [539]
by throwing them. Whatever the case may be, "magical projection" is
probably found at the origin of the theme of the throwing of small fruits or
grains in South American folklore.

[122] PSYCHOLOGICAL ATTITUDES

The Nambikwara offer the observer a very special psychological 157
and moral aspect, and one which we have not found again either among
their immediate neighbors--Paressi, tribes of Guaporé, and Tupi of the
Gi-Parana--or among other South American tribes. It is worth an attempt
to separate its principal characteristics. Few of the primitive South
Americans display so much spontaneity and freedom in their behavior. Few
manifest such ease in psychological relationships, and such grace of ex-
pression. Thus, in their relationships with the ethnologist, the informants
introduce formulae which constitute true sociological inventions in order to 157
respond to a new situation, on the part of individuals who do not use either 571
a formula of greeting or of leave-taking in their own social relationships:

60. tai undejremiẽ ta eikiredniẽ uɔ̃ jiren undetniẽ
tatjene uɔ̃ iritjani. (b1)
I am going to sleep, I am going away, you go to sleep,
I will stay, you go away.

Or to put an end to an interrogation of which they are weary:

61. iejtlana amnentiẽ hikonarijna iatjeny amdeniẽ
konahdiay jedetniẽ. (b1)
This is useless, it must be left; one does not see
clearly any more, this is useless, let us leave it;
tomorrow we will talk.

Or again:

62. nakanajõnjani nihin nalirjani. (b1)
I have forgotten, wait till I remember.

Their daily life is full of exuberance. It is not only in the games 157
of ball that one hears joyous exclamations: 521

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

particular form of their own. Death is identified with these spirits. Men's souls are believed to be reincarnated as jaguars, whereas women's and children's souls are taken away by wind and thunder, never to return.

The highest being is the Thunder, with which any man, though usually a shaman, may have personal contact through revelations and visions. Women, however, except when very old, and children are deprived of these privileges. Women are also forbidden, under pain of death, to see the sacred flageolets (see Musical Instruments, p. 368) played at the ceremonies marking the beginning and the end of the dry season.

SHAMANISM AND MEDICINE

The shaman is sometimes distinct from—but more frequently identified with—the political chief. He is distinguished by having the privilege of polygyny, playing the leading role in ceremonial life, and possessing special supernatural powers. He treats patients by sucking out the disease or by fighting it with small ritual arrows called "thunder-arrows."

In addition to magical cures, the *Nambicuara* treat sickness with numerous medicinal plants, which are used externally or internally according to the disease. For eye infection, which is very frequent, they apply the infusion of a special bark with the help of a container made of leaves.

FOLKLORE, LORE, AND LEARNING

The only legend recorded by Lévi-Strauss (n.d. b) is a flood tale relating the destruction of human life and its re-creation through several incestuous marriages between the offspring of an old woman, who was the only being who escaped the disaster.

The only basic numbers used for counting are one and two, but the natives can reckon higher figures by combining these.

Colors are classified differently according to the dialects. The *Eastern, Central, Southern,* and *Western Nambicuara* agree in putting yellow and green in the same category, whereas the *Northern* group identify red and yellow, and class green, blue, and black together.

Some *Nambicuara* groups call stars by the same name which designates the spirits. The year is divided into two seasons and an undetermined number of lunar months. The day includes six main stages, each based on the position of the sun. Space is divided into two sections that are perpendicular to each other, one corresponding to the apparent movement of the sun and the other to the direction of the main waterways.

BIBLIOGRAPHY

291 Around the waist both men and women wear a buriti cord; if possible, this string is strung with glass store beads. In addition, men sometimes suspend a lenth of buriti fiber from the front of the belt.

302 Men paint their faces with urucú, drawing a band from each side of the forehead down to the chin, another band across the eyes and bridge of the nose, and then a band from under each eye across the cheeks. On the body they draw two stripes, starting from the abdomen up to the nipples and then over to each shoulder. The arms and legs are dotted with red or black spots. The hair is seldom smeared with urucú.

SOCIAL ORGANIZATION

(See chart 12) $\frac{1}{A}$

619 The names of the Eastern Nambicuara bands
621 appear to be derived from characteristics peculiar to the band territory. The Waklítisu are cayman people for there are many caymans (*waklítsu*) in their territory. The Elótasu are open plains people, for they live on the open plain (*tátu*) of the upper Camararé River. The Kitánhlu get their name from a small fruit called *tsatu*. The Chiwtisu are bee people from the word *wuiru*, bee. The Hégndisu are buriti fruit (*héru*) people. Although these bands are not politically united under a single chief, and sometimes even resort to open conflict, they consider themselves a single people, or as Julio phrased it, "We can speak with one another and we came from the same hole in the stone mountain."

619 The origin myth of the Eastern Nambicuara, as
●773 it is told among the Waklítisu band, can be summarized as follows:

Before the Nambicuara came there were only animals, birds, plants, and beings who could change from animal and bird to human form. At that time the Nambicuara were inside a stone mountain called *pakatadurubatá*, which is situated north of the telegraph line near Campos Novos (roughly in the center of the territory now occupied by the Eastern Nambicuara). One day the monkeys heard people speaking inside the mountain and went to tell ehlíkdilisu who changed himself into a black and white woodpecker and flew with all his strength against the mountain. When the mountain broke some were killed and some injured but many came out alive. The ghosts of the dead people remained around the mountain where they still are and where all Nambicuara go after they die. The injured people ehlíkdilisu sent into the bush, but the people who were sound of body he put into good clean places and gave them the pieces bow and taught them how

2/2 [Cat. 116, p. 123.—Haskell] [p. 96 (A)]

SP17 Nambicuara SP17

619 to grow manioc and sweetpotatoes. He also gave them the flute (*udárku*), and taught them how to sing and
•773 dance. *Ohlálólilau* is thus the culture hero of the Nambicuara. In human form he looks like a Nambicuara Indian, wears ornaments in his ears, nose, and upper lip and paints himself with urucú. Yet today people no longer see *ohlálólilau*, for he has gone away. They do not have rituals connected with him, nor do the shamans solicit his aid. But the stone mountain from which the Nambicuara came is still recognized as the place of the dead. On ceremonial occasions the ghosts of the ancestors come to the encampments and villages from the mountain, returning after they have been given food.

622 Although every band has a leader or chief it is not quite certain whether these leaders get their positions through succession or by personal strength and prestige. Julio claimed that he is headman because his father was a headman, but the other members of the Wakítisu band claim that the strongest man is always the leader by common agreement. The Nambicuara appear to value two qualities in a man—"a strong body" and "a strong mouth." The chief is like a tapir (*sílasu*) which is the strongest of the animals; thus, a chief is called *silasúdisaru*. A shaman gains power by talking or by having "a strong mouth," as the Nambicuara say. The strongest man is one who combines these qualities and is at once a strong man and shaman—he becomes an important chief.

The survival of the band, the Nambicuara believe, depends upon the *silasúdisaru*. He is the hunt leader, the head farmer, the one who organizes trade between the bands, the ceremonial head, the war leader, and the settler of disputes. Every successful chief is supposed to have four wives but otherwise has nothing to distinguish him from the rest of the tribesmen.

619 Relationships between the bands of the Eastern Nambicuara are characterized by intermarriage, trade, occasional joint ceremonies, and wife stealing and consequent armed conflicts. Intermarriage occurs when cross cousins are not available for marriage within the band. The Chiwíisu and Hágudisu obtain pots from the Western Nambicuara in exchange for wax, feather ornaments, beads, and bows and arrows. These pots they in turn exchange with the Eastern Nambicuara bands for knives, axes, and tin cans.

[582] 438 619

When one band wants to meet another in order to exchange goods the approach is made in a very formal manner. The approaching band stops

[p. 96 (B)]

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

The chief advises—

[627] [623] like quarrelsome individuals but appears to have no powers of coercion. The Wakitáuu claim that individuals quarrel but they do not fight among themselves nor do they remember any cases of murder. Unwanted individuals are exiled by common agreement. Houses, fields, and some implements are common property, and food is shared among the members of the band. Axes, machetes, and knives, although owned by individuals are freely used by other members. At death, privately owned tools pass to a man's sons or to his brother. The bow is customarily broken and left on the grave. Even these rules are not strictly adhered to, for when a man becomes seriously ill other men begin to help themselves to his property and the one with the "strongest mouth" gets the most. If the man recovers he cannot reclaim his things but must set about accumulating a new supply.

421

[928]

[769]

593 The wife and the children are under the strict control of the husband. Although boys must obey their fathers they owe no special obedience to their mothers. Boys sometimes throw stones and sticks at their mothers and the old women; the older men not only laugh but even encourage this disobedience. The bond between brothers is very [837] close. On occasion they share each other's wives. No particular respect is paid to in-laws.

RELIGIOUS BELIEFS AND PRACTICES

● 774 According to the Wakitáuu the spirits are the source of all danger, misfortune, sickness, and death. The ghosts of the dead (*sydehadiru*), [782] bring sickness unless offerings of food are made to 753 them. The ghosts of dead shamans (*sydéwu*), be- [821] longing to other bands bring thunderstorms which destroy gardens and make hunting difficult. In 776 addition to the ghosts, there is *tawpté*, the hawk of death who lives in the sky, and *wiwé*, the evil armadillo who lives under the ground and wants to destroy the villages and camps of the Nambicuara.

Tawpté is an enormous hawk with huge wings, tail, and claws, who sits in a tree made of human [821] bones. This tree (*lalukutru*) is situated on the shore of a shallow lake in the sky. Shooting stars are caused by *tawpté* defecating at night. A small red bird (*dintewuu*), who lives with *tawpté*, urinates into the lake and when it fills up the urine overflows and comes down in the form of rain.

[p. 99(8)]

THEORY OF DEATH

761 [100] Death distinguishes between men on one hand, women
●775 and children on the other. When they die, the former are transformed into jaguars who represent, consequently, so many reincarnated humans. The women and children, on the other hand, disappear with the wind and the storm and are not susceptible to any reappearance.

40. denõ dũrige uetnatũrina ednadure lukuĩndige ndakuĩndige monãnkiadukuĩndige denõ dũrige monãure lĩrige amonotlĩrtige toyodũrige uitendige (b1)
The woman and child who die do not change into beasts. The man who dies is changed into a jaguar, the woman who dies goes away with the tempest disappears with the storm.

262 Whence, among the Nambikwara, the only perfectly clear prohibition concerning food. Theoretically several exist, broken each time that the occasion is presented, such as those concerning the hawk, the worms from the bacaiuva nuts, and there may be added a probable repugnance concerning the meat of the veado (Cervus sp.). Chickens and dogs are never eaten, but their introduction is recent.
[224 On the other hand, the jaguar can be hunted and killed, and its re-
281 mains are highly regarded since the hide is used to make the fur
714] bonnets worn in the attire of war; but it is not eaten under any pretext:

41. [following preceding text] loukuĩndige inkara uĩrige lotsũrige ikuitãdige uĩrige (b1)
775 [the dead man] becomes a jaguar, another eats him, the jaguar carries him off, he is left to another in order to eat him.

This theory complements the information collected in the eastern group more than it differs from it. The jaguar in fact plays the same role as the atãsu, it also carries off the dying. But the central theory adds a complement. This is that the deceased is identified with the animal, who thus becomes a supernatural being. It was not possible to find out if the atãsu which one meets at night are considered to be the souls of reincarnated dead people. (1)

776 1. One recognizes in the man-eating jaguar gifted
171 with a supernatural nature a typically Tupi theme, although its present diffusion is much greater. See concerning this subject, Métraux, loc. cit., passim.

2: Levi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

particular form of their own. Death is identified with these spirits. Men's souls are believed to be reincarnated as jaguars, whereas women's and children's souls are taken away by wind and thunder, never to return.

The highest being is the Thunder, with which any man, though usually a shaman, may have personal contact through revelations and visions. Women, however, except when very old, and children are deprived of these privileges. Women are also forbidden, under pain of death, to see the sacred flageolets (see Musical Instruments, p. 368) played at the ceremonies marking the beginning and the end of the dry season.

SHAMANISM AND MEDICINE

The shaman is sometimes distinct from—but more frequently identified with—the political chief. He is distinguished by having the privilege of polygyny, playing the leading role in ceremonial life, and possessing special supernatural powers. He treats patients by sucking out the disease or by fighting it with small ritual arrows called "thunder-arrows."

In addition to magical cures, the *Nambicuara* treat sickness with numerous medicinal plants, which are used externally or internally according to the disease. For eye infection, which is very frequent, they apply the infusion of a special bark with the help of a container made of leaves.

FOLKLORE, LORE, AND LEARNING

The only legend recorded by Lévi-Strauss (n.d. b) is a flood tale relating the destruction of human life and its re-creation through several incestuous marriages between the offspring of an old woman, who was the only being who escaped the disaster.

The only basic numbers used for counting are one and two, but the natives can reckon higher figures by combining these.

Colors are classified differently according to the dialects. The *Eastern, Central, Southern,* and *Western Nambicuara* agree in putting yellow and green in the same category, whereas the *Northern* group identify red and yellow, and class green, blue, and black together.

Some *Nambicuara* groups call stars by the same name which designates the spirits. The year is divided into two seasons and an undetermined number of lunar months. The day includes six main stages, each based on the position of the sun. Space is divided into two sections that are perpendicular to each other, one corresponding to the apparent movement of the sun and the other to the direction of the main waterways.

776 under the ground from where ahihdihiri, the culture hero, once released them. They add that they expect this to happen some day.

756 The man who is responsible for guarding the band against evil spirits is the shaman (wandegédiw). In this task he is assisted by the ghosts of dead shamans of his own band. The spirit or ghost of a dead shaman is known as *ewéwe* and is sharply distinguished from the ghosts of non-shamans (*apihdadiw*). The *ewéwe* of other bands, however, are considered evil for they bring thunderstorms. When speaking about shamans and shaman spirits in Portuguese, the Nambicuara refer to both as "trovão" (thunder). This has led many observers to the conclusion that the Nambicuara believe in a thunder spirit. Among the Wahihiw, at least, "trovão" or thunder is nothing more than a shaman or a shaman spirit. Actual thunder, which is caused by a shaman spirit is called *ihihi*. A shaman spirit may also enter the body of a jaguar (*yandwa*), and cause harm to people.

821 The Nambicuara do not like heavy and prolonged rainstorms, for they say that the winds blow down their houses, the lightning sometimes kills people, and the rains wash away the tracks so that they and their dogs have difficulty in following game. To pacify the evil *ewéwe*, who has caused the storm, the shaman makes a cigar-shaped bundle (*yahidewéwe*) out of certain dry leaves, which he ties with cotton twine, leaving long tails at each end. When he wants to stop the rain he lights one end of the bundle, and as it begins to smoke he waves it in the direction of the storm, telling the rain to go away. "Go away, go away, don't be angry at me," he says as he waves the bundle four times. If this does not stop the rain the shaman takes the sword club (*kalakaliw*), which appears to have magical powers, and cuts the rain. If the rain still persists, he lights three smudges made by mixing "para toda" leaves with the *yahidewéwe* leaves. When the smoke rises from the smudges he takes a burning brand and waves it against the storm telling it to stop.

756 The shamans of one band also practice sorcery 758 against individuals in another band by asking their *ewéwe* to inject objects into their bodies. When a shaman wishes to inject an object into his enemy he retires into a special hut (*silidewéwe*) and

756 by singing calls his enêwa, who eventually comes
754 up out of the ground in front of him. The enêwa may be in the form of a bird or a jaguar, but is very small in size. The shaman wears a hat made from a jaguar skin and a necklace made from jaguar claws and teeth. The shaman offers the hat and the necklace to his enêwa if he will do his bidding. If the enêwa is satisfied with the singing and the decorations he will carry out the shaman's orders. The procedure followed in curing
755 an individual who has been made ill by sorcery is much the same. The shaman calls his enêwa by singing and asks that he help him draw out the object. The enêwa enters the shaman, who then sucks out the dangerous object. In mild cases the shaman draws out bamboo slivers, but in cases of severe illness he draws out the bones of fish or the entrails of birds.

• 775 The ghosts of the dead (opôlohuêwa) who live around the stone mountain from which the Nambicuara came, periodically come to the villages and camps asking for food. They are not dangerous if they are well-treated. When the shaman says that the opôlohuêwa are around, the people prepare manioc cakes, roast ears of maize, and broil meat. They then gather around the shaman and sing together with the ghosts. The shaman thanks the ghosts for their singing and they finally go away. If the ghosts are dissatisfied with
[753] the offerings and the singing they become angry
[755] and make the children ill. To cure the children, a more elaborate feast has to be prepared for the ghosts.

775 In every case, contact with the ghosts of the
553 dead or with the spirits of dead shamans is made through singing. The Wakitîtau do not use tobacco, drums, or rattles to communicate with the supernatural. One becomes a shaman when he learns the songs of an enêwa, which he later uses whenever he wishes to contact his spirit helper. Everyone in the band appears to know the songs which bring the opôlohuêwa. Shamans practice
[534 continence before important rites, for if the
754] enêwa observe sexual intercourse they become angry and take away all the cotton from the bushes.

757 In addition to treating illness through shamanistic practices, the Nambicuara resort to more practical methods. They know herbs, the juice of which is later poured over the head or stomach of a

757 patient. The juice of a certain plant is put into the cavities of teeth to stop toothache. The juice of boiled roots and leaves are taken internally for stomach disorders. One day I observed a woman pressing her foot over her husband's forehead as he lay on the ground. The heel was placed over the eye and she exerted considerable pressure. She was doing this to cure her husband's headache. These nonmagical practices are known to everyone. Some herbal medicines, however, are known only to the shamans and are used under the directions of the seniors.

778 The sacred flutes (*udiwiu*) are associated with
534 *ohkikiñiru*, the culture hero, agriculture, and chieftainship. As these flutes are similar in appearance to the sacred flutes of the Parecí, among whom they have great significance, it is possible that the Nambicuara obtained them originally from the Parecí. The flutes are about 2 feet long with four holes at the lower end and are made from a jointless piece of bamboo. When the band settles down near their manioc fields they build a special hut for the flutes, but when they are wandering around, the flutes are hidden in the
[784] woods. Women are not permitted to see the flutes, and if one should accidently see them her stomach would swell and she would become ill. But what appears more important is the fact that the flutes poison people who do not treat them well. Yet, as only the chief and the head shamans play them this would mean that the flutes are the symbols of authority representing the men in whom power is invested. The flutes, four of which should be in every band, do not represent a spirit but appear to be more like fetishes. Boiled manioc juice is poured into them and they are offered maize and broiled meat.

241 The *udiwiu* are played after the fields have been
●775 planted and again at harvest time. After planting, the men gather into the flute hut and play
533 the flutes and sing the *ewipáwe*. The ghosts of the dead participate and, along with the flutes, are offered food and drink. At harvest time another ceremony called *hañkwañkiñáwe* is performed at night during which the flutes are played and special songs are sung. The following day the whole band participates in a dance. The ghosts also take part in this ceremony.

534 In addition to the *udiwiu* flutes, the Nambi-
cuara have a smaller four-step bamboo flute called

BURIAL

763 When it is seen that a person is about to die the women wail for a while and then they all turn their backs to the dying person and begin to divide up his belongings. The corpse is buried 764 in a grave dug in the village or camp site. The men loosen the soil with sticks and scoop out the soil with gourds until a roughly rectangular grave about 5 feet deep is dug. The men who lower the body into the grave take three balls of soil from the bottom of the grave with which they rub their legs and backs. A man's decorations are placed in the grave with him. In the case of a woman, two or three gourds are placed at her feet. The grave is then covered. A man's bow and arrows are broken and left on the grave. The rest of his belongings are burnt nearby and the people go on a hunt for a few days. A bit of buriti fiber is left to mark the grave of a boy, although nothing appears to be left over the grave of a woman or a girl.

● 775 The ghost remains around the grave for several days and then goes to the sacred mountain where all the ghosts live. In the land of the dead the ghosts have fine necklaces, and nose feathers, and are always painted with urucú. But they do not wish to be forgotten and want the living to give them food. The Nambicuara do not fear ghosts, and like to have them participate in their ceremonies.

764 Two days before we left Utiarity, Marciano died. He was one of our best informants, the least nervous and most helpful. A week earlier he caught cold which turned into pneumonia. It was pitiful to watch this naked man lying in the dirt beside a fire slowly gasping out his life. Once in a while he became conscious and tried to sing, calling the spirits to help him. About 9:30 that night he died. As there is something symbolic in his death and burial I would like to end this account of the Nambicuara with an entry from my diary dated July 30, 1949.

This morning we all went to the burial, the Jesuit priests, the Protestant missionaries, some of the Brazilians, and Kazuo and I. We dug a grave at an old Nambicuara camp site about a half a mile from Utiarity. As we walked along the telegraph line bearing Marciano's body the cahiá were singing and the air was full of the sweet odor of the timbó vine. Wrapped in a ragged blanket Marciano was lowered into his grave along with his

This theory complements the information collected in the eastern group more than it differs from it. The jaguar in fact plays the same role as the atsiu, it also carries off the dying. But the central theory adds a complement. This is that the deceased is identified with the animal, who thus becomes a supernatural being. It was not possible to find out if the atsiu which one meets at night are considered to be the souls of reincarnated dead people. (1)

776 171 1. One recognizes in the man-eating jaguar gifted with a supernatural nature a typically Tupi theme, although its present diffusion is much greater. See concerning this subject, Métraux, loc. cit., passim.

●T16
171

and Nimuendaju, "Die Sagen von der Erschaffung und Vernichtung der Welt als Grundlagen der Religion der Apapocuva Guarani," Zeitschrift fur Ethnologie, Berlin, XLVI, 1914. Also, the atãsu in question in the preceding paragraph, curiously evoke the yurupari, or ananga, ancient Tupi genies of the bush against which they defend themselves with a flaming torch which thus plays the same role as the magic javelin (cf. Thevet, cited by Metraux, loc. cit., p. 61). Finally, the atãsu itself often appears in the form of the jaguar; and in the eastern groups at least, it plays the role of the Messenger of Death which the central, southern, and northern groups give over to the jaguar. There is thus in the vocabulary, a close connection between the stars, the jaguar and the atãsu, already noted by Claude d'Abbeville (cited by Metraux, l. c., p. 49) among the Tupinamba: these identified the jaguar with the stars. Like the "celestial" jaguar (Montoya), the "man-eating" (Nimuendaju), the jaguar of the Nambikwara presents a remarkable ambivalence: it is sacred, and at the same time, they kill it. Finally, comparative linguistics confirms the connection. The term which means jaguar in dialect a1, inãñu is associated with the name of the jaguar among the central and southern Tupi: yaouare (Emerillon, Coudreau); iaoruhu (Guajajara, Nimuendaju); jaoarohu (Tapirapé, Kissenberth).

[101] COMMUNICATION WITH A SUPERNATURAL WORLD: SHAMANISM.

T87

It is considered possible to receive visions of far-distant things and revelations of future happenings. These supernatural communications are usually produced upon the occasion of tempests and storms. They are sudden and unforeseen. Every adult male is apt to [263] receive them, for in this case too, the women (except, it seems, the oldest) are excluded from the spiritual life:

42. inãñdãni dẽñõ tamãmatarjani nahoe ejãni ekwãjeni kanahãdan natli aikwasyatirhemete (b1)
Invisible to women the men see it [the thunder]: "Far away I see, close by I see, tomorrow it will arrive, very near it will arrive."
(It is a question here of a warning vision of messengers come from another tribe).

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

533 **Music and dance.**—Music is clearly tonal, with melodic structures easy to identify. The end of a melody is usually marked with several shrill sounds which are repeated after each coda. Music is both instrumental and choral and usually accompanies dances.

535 Dances are performed under the leadership of the chief. Men and women stamp rhythmically on the ground while turning in a circle. Usually, dancers close one nostril with the left hand to make their singing nasal. Only men perform war dances, forming one or more rows and stepping forward and backward in front of the leader. In the second phase of the dance, they attack a post, a symbolical enemy, with bows and arrows, and clubs. Most of the dances and songs are connected with hunting or seasonal ceremonies, but they may be used at any time for mere entertainment.

534 **Musical instruments.**—Flageolets have four holes and an air duct; three are usually played together, accompanied by a rhythm trumpet made of a piece of bamboo with a hollow calabash fixed to its bottom. Nose flutes (pl. 36, *top, right*) are made of two pieces of calabash glued together with wax and pierced with three holes. One hole is blown with one nostril while the other nostril is closed with the thumb; the other two holes vary the notes. Nose flutes are also played in unison. Double and treble whistles have the air duct cut in the middle of the pipe, so that they can be blown at either end. Panpipes (pl. 36, *bottom, left*) are of two kinds: the common type has five pipes; the other type consists of two or three reeds cut obliquely at the mouth-end. All pipes produce approximately the same note in the latter.

272 273 **Drinks and narcotics.**—Drinks are made with crushed manioc or maize mixed with water, or of palm fruits, especially *Maurítia* sp., *Attalea* sp., and *Oenocarpus distichus*. A slightly alcoholic beverage is prepared of wild pineapples mixed with water.

276 The *Nambicuara* are ardent smokers. They cultivate a tobacco with tiny leaves, which they dry between two pieces of wood, crush with their hands, and store in small calabashes. Cigarettes are rolled in special leaves and tied with grass.

MAGIC AND RELIGION

771 The *Nambicuara* believe in the existence of a diffuse power or substance which may occur in objects and in living beings. It is manifest mostly in poisons, some of which are real (see Weapons, p. 366), some purely magical. To the latter belongs the resin of the barriguda tree (a Bombacaceae), which is kept in tubes like the true poisons. When thrown by a special technique at an enemy, it is believed to make him swell like the trunk of the tree and die.

776 There are also dangerous spirits of the bush and of water, which may appear in the shape of an animal, especially the jaguar, or in a

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

particular form of their own. Death is identified with these spirits. Men's souls are believed to be reincarnated as jaguars, whereas women's and children's souls are taken away by wind and thunder, never to return.

The highest being is the Thunder, with which any man, though usually a shaman, may have personal contact through revelations and visions. Women, however, except when very old, and children are deprived of these privileges. Women are also forbidden, under pain of death, to see the sacred flageolets (see Musical Instruments, p. 368) played at the ceremonies marking the beginning and the end of the dry season.

SHAMANISM AND MEDICINE

The shaman is sometimes distinct from—but more frequently identified with—the political chief. He is distinguished by having the privilege of polygyny, playing the leading role in ceremonial life, and possessing special supernatural powers. He treats patients by sucking out the disease or by fighting it with small ritual arrows called "thunder-arrows."

In addition to magical cures, the *Nambicuara* treat sickness with numerous medicinal plants, which are used externally or internally according to the disease. For eye infection, which is very frequent, they apply the infusion of a special bark with the help of a container made of leaves.

FOLKLORE, LORE, AND LEARNING

The only legend recorded by Lévi-Strauss (n.d. b) is a flood tale relating the destruction of human life and its re-creation through several incestuous marriages between the offspring of an old woman, who was the only being who escaped the disaster.

The only basic numbers used for counting are one and two, but the natives can reckon higher figures by combining these.

Colors are classified differently according to the dialects. The *Eastern, Central, Southern,* and *Western Nambicuara* agree in putting yellow and green in the same category, whereas the *Northern* group identify red and yellow, and class green, blue, and black together.

Some *Nambicuara* groups call stars by the same name which designates the spirits. The year is divided into two seasons and an undetermined number of lunar months. The day includes six main stages, each based on the position of the sun. Space is divided into two sections that are perpendicular to each other, one corresponding to the apparent movement of the sun and the other to the direction of the main waterways.

627 The chief advises
[623] tribes quarrelsome individuals but appears to have no powers of coercion. The Wakitáu claim that individuals quarrel but they do not fight among themselves nor do they remember any cases of murder. Unwanted individuals are exiled by common agreement. Houses, fields, and some implements are common property, and food is shared among the members of the band. Axes, machetes, and knives, although owned by individuals are freely used by other members. At death, privately owned tools pass to a man's sons or to his brother. The bow is customarily broken and left on the grave. Even these rules are not strictly adhered to, for when a man becomes seriously ill other men begin to help themselves to his property and the one with the "strongest mouth" gets the most. If the man recovers he cannot reclaim his things but must set about accumulating a new supply.

543 The wife and the children are under the strict control of the husband. Although boys must obey their fathers they owe no special obedience to their mothers. Boys sometimes throw stones and sticks at their mothers and the old women; the older men not only laugh but even encourage this disobedience. The bond between brothers is very close. On occasion they share each other's wives. No particular respect is paid to in-laws.

RELIGIOUS BELIEFS AND PRACTICES

774 According to the Wakitáu the spirits are the source of all danger, misfortune, sickness, and death. The ghosts of the dead (*opóhodáu*), bring sickness unless offerings of food are made to them. The ghosts of dead shamans (*owáwa*), belonging to other bands bring thunderstorms which destroy gardens and make hunting difficult. In addition to the ghosts, there is *tsopté*, the hawk of death who lives in the sky, and *xlawá*, the evil armadillo who lives under the ground and wants to destroy the villages and camps of the Nambicuara.

[782] [753] [621] 776

Tsopté is an enormous hawk with huge wings, tail, and claws, who sits in a tree made of human bones. This tree (*hóhokatsu*) is situated on the shore of a shallow lake in the sky. Shooting stars are caused by *tsopté* defecating at night. A small red bird (*tóxlawat*), who lives with *tsopté*, urinates into the lake and when it fills up the urine overflows and comes down in the form of rain.

[821]

[p. 99(a)]

776 [753] Tewpté does not cause illness, but when people get sick he begins to eat away the flesh and finally kills them and eventually takes their bones to his abode in the sky. The missionaries told me that when the first airplane appeared in Nambicuara territory the Indians ran into the forest and hid because they believed the airplane was tewpté. Shamans sometimes visit the land of tewpté by riding up to the sky on the back of [756] urutai, the night hawk or goat sucker. Julio claimed that his father-in-law, who was a powerful shaman, had visited the realm of tewpté while in a trance.

776 756 The Wakitibiu fear most of all the spirit armadillo called uluré. When someone sees bits of manioc cake and charcoal floating on the river near the village, he comes back and tells the shaman, who then goes to examine the signs. If the shaman decides that it is uluré, immediate action must be taken to save the world from destruction. The women and children shut themselves in their huts while the men take their wooden sword clubs (kaláhiu) and go to the bank of the river. The shaman then digs a deep hole in the bank, into which he is lowered with a rope. When he has grasped uluré by the tail he signals the men on the surface to pull him out. The shaman remains at the mouth of the hole with his arm thrust in, holding uluré by the tail while with his other hand he marks points on the ground which are directly over the head, heart, and stomach of uluré. One by one the men thrust their sword clubs into the ground at the places marked by the shaman. As they push the blades in they twist them to make sure that they kill uluré. After the spirit armadillo has been killed, the men go back to the village leaving the shaman alone with the dead uluré. The shaman then cuts up the spirit armadillo, washes the pieces in the river, and begins to sing. When the ghosts of the dead Nambicuara hear the song they come and eat the pieces prepared by the shaman, after which they go away happy because the Nambicuara have been saved.

776 [814] The Wakitibiu say that if they should ever fail to kill uluré, a terrific storm would appear followed by an earthquake, for when uluré gets under the village he will turn the world upside down, tewpté will fall down from the sky, and the Nambicuara will be buried again. In short, they will go back

[p. 100 (A)]

776 under the ground from where ohlokólilev, the culture hero, once released them. They add that they expect this to happen some day.

756 375 The man who is responsible for guarding the band against evil spirits is the shaman (*wunégidiev*). In this task he is assisted by the ghosts of dead shamans of his own band. The spirit or ghost of a dead shaman is known as *enónev* and is sharply distinguished from the ghosts of non-shamans (*sytokodiev*). The *enónev* of other bands, however, are considered evil for they bring thunderstorms. When speaking about shamans and shaman spirits in Portuguese, the Nambicuara refer to both as "trovão" (thunder). This has led many observers to the conclusion that the Nambicuara believe in a thunder spirit. Among the Wakihíte, at least, "trovão" or thunder is nothing more than a shaman or a shaman spirit. Actual thunder, which is caused by a shaman spirit is called *líditi*. A shaman spirit may also enter the body of a jaguar (*yunóvu*), and cause harm to people.

821 The Nambicuara do not like heavy and prolonged rainstorms, for they say that the winds blow down their houses, the lightning sometimes kills people, and the rains wash away the tracks so that they and their dogs have difficulty in following game. To pacify the evil *enónev*, who has caused the storm, the shaman makes a cigar-shaped bundle (*yalídenónev*) out of certain dry leaves, which he ties with cotton twine, leaving long tails at each end. When he wants to stop the rain he lights one end of the bundle, and as it begins to smoke he waves it in the direction of the storm, telling the rain to go away. "Go away, go away, don't be angry at me," he says as he waves the bundle four times. If this does not stop the rain the shaman takes the sword club (*halóhlev*), which appears to have magical powers, and cuts the rain. If the rain still persists, he lights three smudges made by mixing "para tudo" leaves with the *yalídenónev* leaves. When the smoke rises from the smudges he takes a burning brand and waves it against the storm telling it to stop.

756 758 The shamans of one band also practice sorcery against individuals in another band by asking their *enónev* to inject objects into their bodies. When a shaman wishes to inject an object into his enemy he retires into a special hut (*nilóvenev*) and

[p. 100 (8)]

757 patient. The juice of a certain plant is put into the cavities of teeth to stop toothache. The juice of boiled roots and leaves are taken internally for stomach disorders. One day I observed a woman pressing her foot over her husband's forehead as he lay on the ground. The heel was placed over the eye and she exerted considerable pressure. She was doing this to cure her husband's headache. These nonmagical practices are known to everyone. Some herbal medicines, however, are known only to the shamans and are used under the directions of the curers.

● 778 The sacred flutes (*udiovin*) are associated with
534 childfolklore, the culture hero, agriculture, and chieftainship. As these flutes are similar in appearance to the sacred flutes of the Parecí, among whom they have great significance, it is possible that the Nambicuara obtained them originally from the Parecí. The flutes are about 2 feet long with four holes at the lower end and are made from a jointless piece of bamboo. When the band settles down near their manioc fields they build a special hut for the flutes, but when they are wandering around, the flutes are hidden in the [787] woods. Women are not permitted to see the flutes, and if one should accidently see them her stomach would swell and she would become ill. But what appears more important is the fact that the flutes poison people who do not treat them well. Yet, as only the chief and the head shamans play them this would mean that the flutes are the symbols of authority representing the men in whom power is invested. The flutes, four of which should be in every band, do not represent a spirit but appear to be more like fetishes. Boiled manioc juice is poured into them and they are offered maize and broiled meat.

241 The *udiovin* are played after the fields have been
775 planted and again at harvest time. After planting, the men gather into the flute hut and play
533 the flutes and sing the *waipatsu*. The ghosts of the dead participate and, along with the flutes, are offered food and drink. At harvest time another ceremony called *kaikaikidatsu* is performed at night during which the flutes are played and special songs are sung. The following day the whole band participates in a dance. The ghosts also take part in this ceremony.

534 In addition to the *udiovin* flutes, the Nambicuara have a smaller four-step bamboo flute called

[p. 101 (N)]

of the Beyond, and condemned to nothingness after death like non-initiated babies. We have described the tender companionship which presides in the relationships between the sexes, and the general harmony which reigns within the groups. But when these are altered, it is to give way to the most extreme solutions, poisoning and murder. It is quite reasonable for the informants to underline spontaneously the role of forgetfulness in funeral rites. (2)

3, P. 112.

For there is a striking contrast between the joyous irony with which one answers someone who is ignorant enough to inquire about a relative deceased for quite awhile: "Hehe, Hehe" (a1), "to the sand! in the sand!," and the horrible apparition of the atëtu which is evoked with ritual sobbing.

Nambikwara rites do not seem to be symbolic in any way. The skeleton-like state of A21 and a22 at the end of the period of abstinence testifies to that, and although ceremonies are rare, they are carried far. The informants speak of periods of three months for the isolation of the young girl entering puberty, and of a bath in the river lasting a whole night as a preliminary to marriage. However much behavior is supple and without complication in daily life, likewise intrusions of the supernatural (in visions and revelations, the séances of shamanism, war dances, etc.) are manifested by the transition to an atmosphere of tragedy. No South American group, to our knowledge, expresses in such a sincere and spontaneous way (for one never feels the theatrical atmosphere of Tupi or chaqueño shamanism) such violent and opposed sentiments, whose individual expression seems inseparable from a social stylization which never betrays them.

• • • • •

It is far from us to wish to assign an exclusively economic cause to this dualism. Nevertheless, it is astonishing to consider that the psychological dualism goes on an equal footing with the organization of social existence around [127] two opposite poles, ...: the one hand the sedentary life, agricultural, based on the dual masculine activity of the construction of huts and of gardening; on the other hand, the nomadic period, during which subsistence is principally assured by feminine collecting and gathering, the one representing alimentary security and well-being, the other chance and want. To these two ways of life, one followed in the winter, the other in the summer, the Nambikwara react in very different ways. They speak of the former with the melancholy which is attached to the conscious and resigned acceptance of the human condition, to the dull repetition of identical acts.

627 The chief admon-
[622] ishes quarrelsome individuals but appears to have no powers of coercion. The Wakitéu claim that individuals quarrel but they do not fight among themselves nor do they remember any cases of murder. Unwanted individuals are exiled by common agreement. Houses, fields, and some implements are common property, and food is shared among the members of the band. Axes, machetes, and knives, although owned by individuals are freely used by other members. At death, pri-
[428] vately owned tools pass to a man's sons or to his
[765] brother. The bow is customarily broken and left on the grave. Even these rules are not strictly adhered to, for when a man becomes seriously ill other men begin to help themselves to his property and the one with the "strongest mouth" gets the most. If the man recovers he cannot reclaim his things but must set about accumulating a new supply.

543 The wife and the children are under the strict control of the husband. Although boys must obey their fathers they owe no special obedience to their mothers. Boys sometimes throw stones and sticks at their mothers and the old women; the older men not only laugh but even encourage this disobedience. The bond between brothers is very close. On occasion they share each other's wives.
[837] No particular respect is paid to in-laws.

RELIGIOUS BELIEFS AND PRACTICES

774 According to the Wakitéu the spirits are the source of all danger, misfortune, sickness, and death. The ghosts of the dead (*opúkodoku*),
• [782 bring sickness unless offerings of food are made to
753 them. The ghosts of dead shamans (*owáwa*), be-
[821] longing to other bands bring thunderstorms which destroy gardens and make hunting difficult. In
776 addition to the ghosts, there is *Saupé*, the hawk of death who lives in the sky, and *wárú*, the evil armadillo who lives under the ground and wants to destroy the villages and camps of the Nambicuara.

Saupé is an enormous hawk with huge wings, tail, and claws, who sits in a tree made of human
[821] bones. This tree (*kítukutwa*) is situated on the shore of a shallow lake in the sky. Shooting stars are caused by *saupé* defecating at night. A small red bird (*kindowan*), who lives with *saupé*, urinates into the lake and when it fills up the urine overflows and comes down in the form of rain.

[p. 99(a)]

796

alãgena haitige (bl)
to sing in the place.

534 A very strict taboo rests on the flageolets. Only the adult
784 men can play them:

46. uitnore uitnia imãgare.
Children do not know how to play the flageolet.

And the sight of the instruments is rigorously forbidden the women:

denaitie iatiaeninitnena ednaio iãineni (bl)
the women cannot see them, only the men see.

These flageolets are made in great secrecy, in the same place where they find suitable bamboo. If the musical expedition returns by day, they hide the flageolets in the branches of a tree not far from the camp or from the village. They only bring them out at night, at the moment of the concert, and the women must then retire to the huts or under the shelters, and hide their heads in
[588] their arms. If one of them violates the taboo, they claim she would be pursued by all the men and killed by blows of a stick. We did not have the chance to attend one of these festivals, but, as we desired to collect the musical repertory of the flageolets, we were able, with a certain amount of difficulty, to arrange it so that a mission was sent to find bamboo and make instruments for us (it was necessary to go about 15 kilometers). Having left in the morning, the group returned in the middle of the night, and until daylight we made music some distance from the camp in order to avoid all feminine indis-
[534] cretion. As each instrument sounds a little different from the others, the playing produces an illusion of harmony which is added to the charm of the melody, in itself very real.

534 It is possible that all the musical instruments of the Nambikwara
784 are connected to activities of an economic-social character. Some testimonials, a decisive confirmation of which I was not able to obtain, present the nasal flutes (aitasu, a2) as meant to assure a rich harvest of the fruit piquy. The season of piquy, which grows in
[122] abundance in the plains, is actually an impatiently awaited period for the Indians. The fruit is admiringly weighed and said to have "lots of fat." Likewise the flutes of Pan (asinzu, a1; iuauzere, b1) would be employed in the rites preceding hunting expeditions. In
[192] the case of nasal flutes, a double analogy has been pointed out by certain informants between their form and that [106] of the pit of the piquy, and between their name and the name of the piquy (ahaitu, a 1/2). The latter analogy exists only in the eastern dialect

846
•784 1. She wears no decoration or ornament;

[107] 2. She does not touch food, neither to harvest it, to gather it, to prepare it nor to cook it;

3. She speaks to no one and no one says a word to her;

4. She avoids groups and when curiosity draws her toward our circle, she attends the distribution and exchange of gifts from a distance and in silence. If someone gives her or her husband a present (for example some beads), it is immediately given to the baby;

5. Every day she receives her food from her mother (a18), who gives it to her without speaking, and occupies herself with certain cares of the baby such as delousing it;

6. She does not bathe in the river, but washes herself with the water which she herself goes to draw in a gourd;

7. She goes away with her husband, sometimes for whole days, and, upon departure, follows him at a distance without saying a word; on these occasions, she takes the baby along;

A21 behaves similarly:

1. He does not go with the masculine group when they go hunting or gardening;

2. He rarely goes away, and then with his wife. The rest of the time he spends stretched out without taking part in any creative activity; they say he is ill (inkatu);

[162] 3. In the degree to which he and his wife perform the most indispensable activities, there is no division of labor between them. Either one buries the baby's excrement, or places in the coals the manioc received by a22 and a18 which constitutes their sole nourishment. Both are extremely thin, and appear very weak; their hair has not been cut or washed for a long time.

Toward June 20, 1938, this behavior was modified. For three consecutive days A21 and a22 disappeared for the whole day, doubtless to hunt, for, after several fruitless trips, they return (June 23 at 15 o'clock) with the following small game:

a. An irara (Mustela sp.);

b. Three bats;

c. Two lizards and their eggs.

846
252 The irara and the bats have already been put over the flame to burn off the hair. a22 begins immediately—and for the first time—to clean and crush a small quantity of manioc and she quickly puts a cake under the coals. At the same time she puts the broken lizard eggs there, and [108] takes them out barely cooked; she divides

757 patient. The juice of a certain plant is put into the cavities of teeth to stop toothache. The juice of boiled roots and leaves are taken internally for stomach disorders. One day I observed a woman pressing her foot over her husband's forehead as he lay on the ground. The heel was placed over the eye and she exerted considerable pressure. She was doing this to cure her husband's headache. These nonmagical practices are known to everyone. Some herbal medicines, however, are known only to the shamans and are used under the directions of the *enduru*.

778 The sacred flutes (*uetiwiku*) are associated with *Alikdalilu*, the culture hero, agriculture, and 534 chieftainship. As these flutes are similar in appearance to the sacred flutes of the Parecí, among whom they have great significance, it is possible that the Nambicuara obtained them originally from the Parecí. The flutes are about 2 feet long with four holes at the lower end and are made from a jointless piece of bamboo. When the band settles down near their manioc fields they build a special hut for the flutes, but when they are wandering around, the flutes are hidden in the [784] woods. Women are not permitted to see the flutes, and if one should accidently see them her stomach would swell and she would become ill. But what appears more important is the fact that the flutes poison people who do not treat them well. Yet, as only the chief and the head shamans play them this would mean that the flutes are the symbols of authority representing the men in whom power is invested. The flutes, four of which should be in every band, do not represent a spirit but appear to be more like fetishes. Boiled manioc juice is poured into them and they are offered maize and broiled meat.

241 The *uetiwiku* are played after the fields have been 775 planted and again at harvest time. After planting, the men gather into the flute hut and play 533 the flutes and sing the *uwipdeu*. The ghosts of the dead participate and, along with the flutes, are offered food and drink. At harvest time another ceremony called *Anikdeal-idutsu* is performed at night during which the flutes are played and special songs are sung. The following day the whole band participates in a dance. The ghosts also take part in this ceremony.

534 In addition to the *uetiwiku* flutes, the Nambicuara have a smaller four-stop bamboo flute called

[p. 101 (B)]

collectively obliged to make reprisals for an injury done one of its members. Much more often, given the very lively and permanent animosity which reigns between the groups, these pretexts good for exciting the spirit are voluntarily entertained, especially if they feel strong either because of the importance of the group's strength or because of an alliance with neighboring bands against a common enemy, concluded by the intermediary of messengers acting as ambassadors. The proposition of war is presented by an exalted individual or one who exposes before his companions his particular griefs, in the same tone and style that speeches were made at the encounter.

39. ẽ akinãẽ ẽednãẽ gõdegãẽ kakonẽ ordnẽ galagnẽnẽ (b1) whose approximate sense is: "Hello! Come here! Let's go! I am irritated! very irritated! arrows! big arrows!" The Indians become so excited upon the occasion of these epic speeches that it is not possible to obtain the commentary of the formula except well after they have been cited and undoubtedly very unfaithfully. But war is not a matter of purely profane decision. It necessitates a preliminary ceremony which will determine if the signs are favorable or not. Dressed in special attire, tufts of buriti straw dappled with red, hoods of jaguar skin, the men assemble under the leadership of the chief and execute the special dance and chant of war. (1) A divining rite

1. Dances and music will be the object of a special publication.

is then performed. The chief, or the sorcerer in the groups where he exists, goes solemnly to hide an arrow in a corner of the bush. The arrow is retrieved the next day. If it is covered with blood, the expedition is undertaken, if not, it is given up. (2) Many warlike

2. This symbolic use of an arrow seems typical of cultures situated north of the Amazon. The fact is interesting, given the northern affinities of the Nambikwara language. Concerning the use of the arrow as the message of war, cf. Roth, "An inquiry," etc., Annual report of the Bureau of American Ethnology, 30, p. 362; Koch-Grünberg, Zwei Jahre unter den Indianern, etc., Berlin, 1910, Vol. II, p. 316; Gumilla, Historia Natural del Rio Orinoco, Barcelona, 1791, Vol. I, p. 134.

expeditions thus begun end after several kilometers of marching.

171

ami Nimuendaju, "Die Sagen von der Erschaffung und Vernichtung der Welt als Grundlagen der Religion der Apapocuva Guarani," Zeitschrift für Ethnologie, Berlin, XLVI, 1914. Also, the atʃu in question in the preceding paragraph, curiously evoke the yurupari, or ananga, ancient Tupi genies of the bush against which they defend themselves with a flaming torch which thus plays the same role as the magic javelin (cf. Thevet, cited by Métraux, loc. cit., p. 61). Finally, the atʃu itself often appears in the form of the jaguar; and in the eastern groups at least, it plays the role of the Messenger of Death which the central, southern, and northern groups give over to the jaguar. There is thus in the vocabulary, a close connection between the stars, the jaguar and the atʃu, already noted by Claude d'Abbeville (cited by Métraux, l. c., p. 49) among the Tupinamba: these identified the jaguar with the stars. Like the "celestial" jaguar (Montoya), the "man-eating" (Nimuendaju), the jaguar of the Nambikwara presents a remarkable ambivalence: it is sacred, and at the same time, they kill it. Finally, comparative linguistics confirms the connection. The term which means jaguar in dialect a1, inaʒu is associated with the name of the jaguar among the central and southern Tupi: yaouare (Emerillon, Coudreau); saoruhu (Guajajara, Nimuendaju); jaoarobu (Tapirapé, Kissenberth).

[101] COMMUNICATION WITH A SUPERNATURAL WORLD: SHAMANISM.

●787

It is considered possible to receive visions of far-distant things and revelations of future happenings. These supernatural communications are usually produced upon the occasion of tempests and storms. They are sudden and unforeseen. Every adult male is apt to receive them, for in this case too, the women (except, it seems, the oldest) are excluded from the spiritual life:

42. iaʒidadni deno tamumatatjani nahoe ejani ekutieni kanahadau uatli aikuaauatli'kentete (b1)
Invisible to women the men see it [the thunder]: "Far away I see, close by I see, tomorrow it will arrive, very near it will arrive."
(It is a question here of a warning vision of messengers come from another tribe).

787 These visions are attributed to the thunder which sends them to men under its semi-personal form amõ.

771 Thus the Nambikwara conceive of three types of supernatural
756 forces: first the power which is abstract, but placed in objects or substances, the nãñde; next the spirits acting in the form of supernatural or seminatural animals, atũñ or jaguar. Finally the thunder, with which under certain conditions, it is possible to entertain personal relations. Each individual can, in a certain measure, establish contact with these forces, however it is the shamans who have the specialized function of intermediary between the human group and the supernatural world. The information which we shall give on this point will be very summary, for it was impossible to obtain from our informants a coherent treatment of the question of shamanism. None of the groups encountered had a shaman with the exception of a single one (group c) where the powers of the chief and the sorcerer were found [102] concentrated in a single individual (C 20). Our best informant, B1, chief of the allied group, was categorical concerning the fact that C20 combined the two qualities of wẽlikabala (chief, c) and of ndãñe (thunder, c) although he was only wẽlikãñde, temporal chief. The sorcerer would then be simultaneously the man who identifies himself with thunder, and who communicates with it in the personal form called amõ. Likewise, in the eastern groups (a1 restricted and enlarged, and a2), it was not possible to uncover the presence of a sorcerer or of an individual with such powers. This fact could be interpreted in three different ways: that the sorcerers were held apart; or that they dissimulated their nature; that the institution of the sorcerer is, in fact, absent in certain groups; or that, in these same groups, the functions of the sorcerer are exercised by the chief, and that, in inverse fashion to what is produced in group c, it is the spiritual functions which are in second place with regard to the temporal. It is this hypothesis which we consider the most reasonable. In group a1, A1 makes the arrow poison and treats sick persons by suction, functions which in group c come within the province of C20 considered as shaman, rather than chief of the group.

756 Whatever the fact may be, and as we have just said, it is the sorcerer who makes the poisons, and it is he who proceeds to the magical treatment of the sick, clearly different from the positive
278 therapeutics likewise practiced. The Nambikwara are familiar with
757 quite a large number of medicinal plants and treat certain illnesses with their help. Thus they care for purulent ophthalmia by an

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

tainship is not hereditary; the chief, when old or sick, designates his successor from the ablest men of the group. The chief's authority is slight; it depends wholly on the good will of the family heads. 622

Relations between neighboring bands are inspired both by fear and by the desire to exchange goods. Warfare, therefore, is closely connected with barter. Groups not acquainted with each other use ritual speech when they meet. 619 438

Before starting a war expedition, a divinatory rite is performed with special songs and dances. An arrow is hidden by the shaman, the outcome of the expedition being presaged by its appearance the following day. 731 787

LIFE CYCLE

Childbirth.—After the delivery of a child, the placenta is buried in the bush and both parents are subjected to rigid prohibitions concerning food, the use of ornaments, and social contacts. 844

Puberty.—The initiation rite for young men consists of piercing their lips and nose and giving them their adult personal name. At her first menstruation, a girl is isolated for several months in a special shelter outside the village, where she is given ritual food by her mother. At the end of this rite, she takes a long bath in the river; this also constitutes the first step of the marriage ceremony. 881 [304]

Both cross-cousin and avuncular marriages (see p. 367), are often planned by parents for their infant children. Marriage is celebrated by festivals, banquets, and dances. The union is pronounced by the chief. Fish and fishing are important both before and during the ceremony. 584 585

Separation is frequent, the chief cause being that the man seeks a younger and prettier woman. There is no social sanction of adultery, except that the seducer is advised by his companion to go away for a while so as to avoid the husband's revenge. A murderer also flees vengeance. 586 684 682

Death.—Some groups of *Nambicuara* bury their dead in a circular pit, the corpse being placed in a crouching position. Others leave the corpse to decompose in an elongated ditch and later wash the bones in the river, put them in a basket, and bury them in the village, which is then abandoned. Weapons, implements, adornments, and other property of the deceased are destroyed, but his garden—if he owned one—is abandoned only for a few months. Later anybody may cultivate it. 764

ESTHETIC AND RECREATIONAL ACTIVITIES

Art.—Most *Nambicuara* groups are completely ignorant of drawing, although some groups decorate calabashes with dots and straight and sinuous lines. These are conventionalized reproductions of realistic designs found among other groups. 531

63. [illegible] [illegible] [illegible] (hl). 157
To me! To me! Throw! 521

However the artisan at work also makes his wife, child, neighbor participate in the execution of the work on whose vicissitudes he comments gaily:

64. [illegible]... [illegible]... [illegible]...

For about seven
221 months these bands go wandering across the prairie in search of small
[222] game, small animals such as caterpillars, spiders, grasshoppers, rodents, snakes, lizards, and so forth, and fruits, grains, roots or wild honey--in short, all that might keep them from dying of hunger. Their camps, set up for one or several days, sometimes for several weeks, consist of as many temporary shelters as families, made of palms or branches stuck in a semi-circle in the sand and connected at the top. This is the period when the quest for food absorbs all activities. The women equip themselves with digging sticks and
221 411 184 the men hunt with the bow and arrow, of which several types must be distinguished. The eastern groups have a bow with a flat section which evolves toward a convex-plane section or a concave-convex section when one moves westward. As for the arrows, those made for hunting birds have a blunted tip. Arrows for fish have three to five points, each one formed like a minute harpoon, and the stem is without barb. The poisoned arrows (1), whose tip is protected [15]

1. See below, p. 96.

by a sheath of bamboo, are reserved for hunting monkeys and small game. Those for large game have a long lanceolate point. The barb is attached or sewed on. Besides the bow and arrow, the men use a club
● [189] which often takes the form of a javelin, and its use is reserved for magic and war operations (1).

1. Cf. below, p. 99.

824 The primary materials of the indigenous industry consist of varied
825 woods, wax from wild bees, resin, fibers of the buriti palm trees (Mauritia vinifera) and tucum (Astrocaryum tucuma) bone of the monkey, teeth and claws of mammals, fur (only to make ornaments), feathers, quills of porcupines, vegetable shells and river shells, stones,
412 cotton and grains. As implements they have knives made from a sharp piece of bamboo, from stones crudely fashioned, or from fragments of iron or steel obtained through exchange, and fixed with the aid of wax and cord between two pieces of wood forming the handle. Drills are made of a borer of stone or iron mounted at the end of a stick
[17] which they turn between their palms. The Rondon Commission expanded the use of axes and metal hammers, and the old stone axes serve now only as small anvil blocks for fashioning shell or bone.
[415] The use of stone polishers must also be mentioned and, among the objects of current usage, the spindles, combs, baskets and gourds to carry water.

collectively obliged to make reprisals for an injury done one of its members. Much more often, given the very lively and permanent animosity which reigns between the groups, these pretexts good for exciting the spirit are voluntarily entertained, especially if they feel strong either because of the importance of the group's strength or because of an alliance with neighboring bands against a common enemy, concluded by the intermediary of messengers acting as ambassadors. The proposition of war is presented by an exalted individual or one who exposes before his companions his particular griefs, in the same tone and style that speeches were made at the encounter.

39. ẽ akinãẽ ẽdinãẽ wõdegãẽ kakonẽẽ ordnẽẽ galaqwẽnẽẽ (b1) whose approximate sense is: "Hello! Come here! Let's go! I am irritated! very irritated! arrows! big arrows!" The Indians become so excited upon the occasion of these epic speeches that it is not possible to obtain the commentary of the formula except well after they have been cited and undoubtedly very unfaithfully. But war is not a matter of purely profane decision. It necessitates a preliminary ceremony which will determine if the signs are favorable or not. Dressed in special attire, tufts of buriti straw dappled with red, hoods of jaguar skin, the men assemble under the leadership of the chief and execute the special dance and chant of war. (1) A divining rite

1. Dances and music will be the object of a special publication.

is then performed. The chief, or the sorcerer in the groups where he exists, goes solemnly to hide an arrow in a corner of the bush. The arrow is retrieved the next day. If it is covered with blood, the expedition is undertaken, if not, it is given up. (2) Many warlike

2. This symbolic use of an arrow seems typical of cultures situated north of the Amazon. The fact is interesting, given the northern affinities of the Nambikwara language. Concerning the use of the arrow as the message of war, cf. Roth, "An Inquiry," etc., Annual report of the Bureau of American Ethnology, 30, p. 362; Koch-Grünberg, Zwei Jahre unter den Indianern, etc., Berlin, 1910, Vol. II, p. 316; Gumilla, Historia Natural del Rio Orinoco, Barcelona, 1791, Vol. I, p. 134.

expeditions thus begun end after several kilometers of marching.

278
[415]

p. 239 and Fig. 34), but seems not to know their usage nor the nature of their content.

usually tied in bundles of two or three or more, and thus all the Indians possess a provision of poison from which they rarely become separated. We were not able to find out anything concerning the preparation of these drugs, but it seems that different varieties exist, used either by men or women. Notably, the poisons whose small doses are contained in the feather quills would be [96] according to an informant, women's poisons, and also much more to be feared. The "tube poisons" (as compared with the arrow poison which is only employed for hunting, and never for war) play an important role in inter-individual relationships. They are the usual instrument for amorous or commercial vengeance. To define these poisons, there are special terms according to dialects. Thus the arrow poison has a special name: inãtu (a1); dãdinesu (a2); tĩ'te, nãnde (b1); dĩ'are (b2); iriwã (c). But all of the arrow poisons and tube poisons are called by a more general term, belonging to dialect b1, but which is understood and used by all the groups: nãnde, which one might be wrongly tempted to translate as poison. It must be noted, however, from now on that in the case of tube poisons, the term nãnde means the tube and its contents simultaneously.

●789 However besides these "true" poisons which we shall call scientific, there are other substances whose supposed action is of a purely magical character. Certain tubes contain, not a powder meant to be mixed with food, but fragments of resin of the tree called "barrigudo" or [424] "barrigudeira" in Portuguese (Bombax ventriculosa) and sahãtudĩ'taãru (a1/2), irĩ'dare (b1), jakĩ'ya (c) in Nambikwara. These fragments are used for certain "magic projections" which are carried out in the following way: a fragment of resin is placed between the lower edge of the palm of the left hand, held horizontally, and the tip of the index of the right hand held vertically (position called imehãre [a1]). By exercising strong pressure of the finger on the edge of the other hand, the index trips and throws the small projectile as far as several meters (asatãkedjuzu [a1], adãmdige [b1], ndãmdige [b2]). It is believed that the person reached by a fragment thrown in this way will become like the trunk of the barrigudo tree, narrow at the base and at the top and bloated in the center. He will fall ill, his stomach will begin to inflate, and finally he will die. This method of throwing is also often used for teasing, especially children, and to bombard an adversary with small fruit, with pieces of dirt,

1: Lévi-Strauss--111 E-S (1938-1939)1948 SP17 Nambicuara SP17

●789 or pebbles. The victim receives the attack of which he is the object with indifference, nervousness or anger according to the occasion and the moment, but there is no doubt that even in its profane use as a game, the magic operation has a specific residue, as in the game of "showing one's teeth" ("montrer les cornes") among our children. However the "magical projection" constitutes a modality of action very different from administering a poison of known effectiveness through the blood or the mouth, and the Indians are completely aware of this. They would never mix some tube poison in food of a companion as a joke, knowing very well what the result would be; whereas they have no qualms about entering upon demonstrations of magical projection in the midst of a large assembly, and these demonstrations sometimes end in play with everyone taking part. [97] Here the physiological result is not considered as implied by the very nature of the substance or by the specific effectiveness of the gesture. It is awaited as the result of a whole which is at the same time physical, psychological and motor. It requires evil intention simultaneously with the union of a number of essential or accessory circumstances, all of ritual character, however. Nevertheless the resin, the tube and the operation itself are also called nãnde.

Finally, an anecdote will bring to light a third aspect of the same notion. We had brought along some of those big balloons of multicolored silk paper which are filled with warm air while holding a small torch at their base, and which are let go by the hundreds in Brazil on the occasion of the fête of Saint-Jean. And one night we had the unlucky idea to offer a spectacle to the Indians. A first balloon which caught fire on the ground gave rise to a lively hilarity as if the public had had the slightest notion of what should have happened. In contrast, the second succeeded too well. It rose rapidly, mounted so high that its flame was confounded with the stars, wandered above us for a long time and finally disappeared. But the gaiety of the beginning had given way to completely different sentiments in the crowd. The men regarded us with attention and hostility, and the women, heads hidden in their arms and clinging together, were completely terrified. The word nãnde was repeated constantly. The next morning, a delegation of men came to confer with us, demanding to inspect the whole supply of balloons in order to see "if some nãnde couldn't be found." This examination was done very thoroughly, and then, thanks to the remarkably positive spirit of the Nambikwara (despite what has just been said), a demonstration of the rising power

1: Lévi-Strauss-112 E-6 (1938-1939)1948 SP17 Nambicuara SP17

789 of warm air, aided by small fragments of paper put over a fire, was at least accepted, is not understood. And as usual when it is a question of excusing an incident (which could have had very unhappy consequences), they put all the blame on the women, "who do not understand anything," "were afraid" and feared a thousand calamities. (1)

1. Later, Al asked for some balloons to give a demonstration himself before the combined groups assembled by him. But, less forgetful than he, we obstinately refused.

Two conclusions are gleaned from these facts. The first is that the term of nãnde covers much more than the strict meaning of the word "poison," and that it includes all types of actions of exceptional and likewise menacing character, as well as the products or objects likely to determine this action. All nãnde objects and operations have a common character, expressed by the term kakore. This means the dangerous products or substances, and, at the same time, those of a menacing or dangerous nature which certain living beings may possess by specific or only temporary right. Thus poison, the snake, the poisonous spider, the jaguar, are kakore; but the same is true of an enemy tribe, or an Indian (even if he is a [98] relative or friend) when he projects revenge or is found in a state of violent anger. The second conclusion is that the poisons, whatever may be the positive and utilitarian character of their preparation, are not thought of scientifically as substances provoking physiological disorders, but as vehicles or receptacles of that mysterious force which turns the usual order of phenomena upside down. Nevertheless, nãnde is not conceived of in the abstract form of a power. It resides in, and cannot be separated from, certain apparently recognizable material aspects. When the Indians examined our balloons of silk paper, they sought something there which would be the concrete sign of their magical and malevolent nature; and while they proceeded with their inspection, we wondered anxiously what could be the specific characteristics (happily absent) of the product or the nãnde object. If it is true that the sense of the term nãnde is more complex than that of the word poison, it is no less necessary to recognize that poison carries the better example and the more perfect illustration of the Indian conception. It is a clearly identified substance, and recognizable by its outward characteristics to which its evil effects necessarily correspond.

789 Poison is thus nãñde par excellence, although the latter can exist in other forms, at the same time less precise and more complex. We attach extreme importance to the fact that a rigorously utilitarian technique of the manufacture of poisons is found associated with a theory which accounts for their effectiveness through the intermediary of metaphysical concepts. The presence among the Nambikwara of a curare reduced to a basic product, and whose preparation excludes all ritual, associated with the very low cultural level of these Indians, poses in a particularly impressive way the question of finding out if these characteristics which are very primitive are so by origin or constitute the residue of an impoverished culture. Now, it is much more reasonable to interpret the apparent contradiction of theory and practice in matters of poison by the loss of complex rituals which farther north are attached to the making of curare, than it would be to explain how a theory of supernatural character could have been built on the bases of treatment which has remained purely experimental, of the root of the strychnos.

[121 176]

Besides the potion of nãñde we should examine another which is the object of a particularly advanced elaboration among the eastern groups, that of the atãñu (al). Atãñu signifies animal, but the use of the term by the Indians is complex. First of all it is the animal taken in a generic sense, in opposition to the inanimate. They present me with a honey cake and, pointing out the body of a bee which is still in it, I ask what it is. They do not answer, "it is a bee" but: atãñu, "it is the animal." Atãñu also means real animals, but ones without their own names in the vocabulary, and which are of particularly fearful character. Thus oxen are called by this name by the Nambikwara who never saw any [99] before the years 1910-1915, and who entertain a great fear of them. Then we find the same term to designate the stars (eastern groups), and the same name is given to the ticktock of the clock, both conceived of as realities animated by mysterious characteristics. Finally, atãñu is a special animal of supernatural essence, which is seen appearing in two cases—at night, on the road, in certain places and during certain periods, and upon the approach of death. In the first case, one risks being attacked and killed by the atãñu if one does not defend oneself in the appropriate manner. This means is found in the throwing stick [épieu] (distinct from the digging stick), thrown in a prescribed manner. The throwing stick, a large piece of wood of flattened form and pointed at the end is furnished with a handle usually decorated with black and white bark weaving (javelin: hi'dosu [a1], kehujere

789 411

[286 531]

[b1], makalé [c1]). This instrument is used in three circumstances: in war; to conjure up (or to attract?) rain by manipulating it according to an approved ritual as if one were tracing signs in the air while brandishing it; finally to kill the atúru, by throwing it in the direction of the apparition, using as intermediary a tooth of the jaguar: the throwing stick is placed obliquely in the left hand, the point turned in the direction of the atúru, and the tooth, manipulated by the right hand, acts as a hook for projection. The atúru appears only at night. It may borrow the form of the jaguar or of other animals who are then filled with murderous intentions. When the atúru is caught in his terrestrial form at the point of the javelin, a great flow of blood is produced. The "supernatural" animal is never eaten. They abandon its body to the carrion.

In the second case, one is faced with a real theory of death. The sick person who sees the atúru appear knows that he is condemned, and the animal actually carries him off on the spot or returns to get him a little later. The current version of the death of A21, drowned in a river in July 1938, was that the atúru carried him to the bottom of the waters. The atúru would live in the water. An informant described it as having "a large mouth and lots of collars."

The southern, central and northern groups bear witness to a more elaborate religious thought. Among these peoples, the preceding notions are [illegible] by a third, which does not appear as clearly in the eastern [illegible] although it is probably present, that of the wind and thunder, hypostasized in the forms of a semi-personal power named amó. (1) In these groups, this is substituted for the atúru in the theory

1. The Tupi origin of this term is evident. One can compare Montoya, "amá: cloud of waters; Nogueira, "amá: cloud; Coudreau (Bibliothèque Linguistique Américaine, XV, 1892), "amane (Oyampi): rain; Gonçalves Dias, "amana: (chuva) rain; Kissenberth (Baessler Archiv, VI, 1-2, 1916-1917), "amana, aman, ama" (Tapirapé): rain; Nimuendaju (Zeitschrift für Ethnologie, XLVI, 1914), "amá (Lingua Géral): (chuva) rain.

of death, and it is possible to communicate with it through revelations and visions.

796

alãgena hãitige (b1)
to sing in the place.

534 A very strict taboo rests on the flageolets. Only the adult
784 men can play them:

46. ũftnore ũftnia imãgare.
Children do not know how to play the flageolet.

And the sight of the instruments is rigorously forbidden the women:

denaãtie iatiaeninrhena ednapo iãineni (b1)
the women cannot see them, only the men see.

These flageolets are made in great secrecy, in the same place where they find suitable bamboo. If the musical expedition returns by day, they hide the flageolets in the branches of a tree not far from the camp or from the village. They only bring them out at night, at the moment of the concert, and the women must then retire to the huts or under the shelters, and hide their heads in
[688] their arms. If one of them violates the taboo, they claim she would be pursued by all the men and killed by blows of a stick. We did not have the chance to attend one of these festivals, but, as we desired to collect the musical repertory of the flageolets, we were able, with a certain amount of difficulty, to arrange it so that a mission was sent to find bamboo and make instruments for us (it was necessary to go about 15 kilometers). Having left in the morning, the group returned in the middle of the night, and until daylight we made music some distance from the camp in order to avoid all feminine indis-
[534] cretion. As each instrument sounds a little different from the others, the playing produces an illusion of harmony which is added to the charm of the melody, in itself very real.

534 It is possible that all the musical instruments of the Nambikwara
●789 are connected to activities of an economic-social character. Some testimonials, a decisive confirmation of which I was not able to obtain, present the nasal flutes (arãtasu, a2) as meant to assure a rich harvest of the fruit piquy. The season of piquy, which grows in
[122] abundance in the plains, is actually an impatiently awaited period for the Indians. The fruit is admiringly weighed and said to have "lots of fat." Likewise the flutes of Pan (asinzu, a1; iuauzere, b1) would be employed in the rites preceding hunting expeditions. In
[142] the case of nasal flutes, a double analogy has been pointed out by certain informants between their form and that [106] of the pit of the piquy, and between their name and the name of the piquy (ahãru, a 1/2). The latter analogy exists only in the eastern dialect

534 (arɨtasu-ahɨru), and the connection remains suspect, the Nambikwara
789 not disdaining puns. (1) The same thing goes for the flutes of Pan,
[512]
[522]

1. For example, A1 mocks me when I am in the process of smoking: Kukedetu ukedetu: a smoker is lazy.

sometimes called duʔuru (a1/2) duʔunde (b1) which would also be the name of the animal agouti (Dasyproctas aguti). It is no less true that
[533] several of the songs collected have been pointed out as songs of the hunt or of the harvest. A soldier of the Rondon Commission, prisoner of the Nambikwara for quite a long time, described to Roquette Pinto (2) a ceremony composed of dances and songs which had

2. Loc. cit., p. 234-235.

followed a tapir hunt. And a musical theme was pointed out to us spontaneously as the song of the tapir hunt.

FROM BIRTH TO DEATH

844 The Nambikwara woman gives birth (to be born: talɨttige, b1) in a crouching position and getting support on the ground by means of a vertical pole which she holds with both hands. During this time a companion pours cold water over the chest and stomach with a small gourd. The umbilical cord is cut close and cauterized with a live coal, then covered with a salve of warm ashes.

47. dosu sajkedutuʔakedatelusu alɨtu usiɨnkedjutu inketu jakesɨjutu ire ire iagekediute (a1)
[When] the woman gives birth the placenta is buried in the bush; she is ill, she does not eat [for] a moon, a moon [and then] she eats again.

846 After the ceremony of burying the placenta, consequently, the woman would remain for two months under a taboo and condemned to relative abstinence. In reality, an exceptional situation is prolonged much longer, the period of abstinence observed by the husband and wife until the child is weaned, or at least until he ceases to be exclusively nourished by the mother's milk.

To describe the state of abstinence (inkatu, "one is ill" [a1]; there is no special term), we can do no more than to transcribe our observations made from day to day relative to the family of fire 6 composed of A21, a22, and a23. a22 is clearly distinguished from her companions:

In older versions, the old women (since
the old women share the magic powers of the men among the Nambikwara 773
as also in other tribes) (4) was undoubtedly not content with measuring the 171
[789]

4. Cf. above, p. 101.

fall of water by the duration of the fall of her nuts, she actually provoked it [539]
by throwing them. Whatever the case may be, "magical projection" is
probably found at the origin of the theme of the throwing of small fruits or
grains in South American folklore.

[122] PSYCHOLOGICAL ATTITUDES

The Nambikwara offer the observer a very special psychological 157
and moral aspect, and one which we have not found again either among
their immediate neighbors--Paresi, tribes of Guaporé, and Tupi of the
Gi-Parana--or among other South American tribes. It is worth an attempt
to separate its principal characteristics. Few of the primitive South
Americans display so much spontaneity and freedom in their behavior. Few
manifest such ease in psychological relationships, and such grace of ex-
pression. Thus, in their relationships with the ethnologist, the informants
introduce formulae which constitute true sociological inventions in order to 157
respond to a new situation, on the part of individuals who do not use either 571
a formula of greeting or of leave-taking in their own social relationships:

60. tai undeiretnĩẽ ta eikiredniẽ nã̀ iiren undetniẽ
tatiene nã̀ iritiani. (b1)
I am going to sleep, I am going away, you go to sleep,
I will stay, you go away.

Or to put an end to an interrogation of which they are weary:

61. iejtlana amnentiẽ hikənarigna iatien amdeniẽ
kənahadiau iedetniẽ. (b1)
This is useless, it must be left; one does not see
clearly any more, this is useless, let us leave it;
tomorrow we will talk.

Or again:

62. nakanaiõniani nihin nalitiani. (b1)
I have forgotten, wait till I remember.

Their daily life is full of exuberance. It is not only in the games 57
of ball that one hears joyous exclamations: 521

63. tenũkuẽ tenũkuẽ utanãtiri (b1).
To me! To me! Throw!

157
521

However the artisan at work also makes his wife, child, neighbor participate in the execution of the work on whose vicissitudes he comments gaily:

64. itiouĩ taninjẽ diuĩn... ãmi... kãdaha... munjalina... kãdjanene... nooua... taluunlẽ... nothin... ishena... muhjena. (b1)
Hold it [the cord] so that I can twist it... let it go! It fell!... There!... It is difficult!... It is done!... Does it suit you?.. It is ugly!... No, it is pretty!

The last formula is ritual, it is the one they use at the end of chants and dances; the protagonists excuse themselves: "it is ugly"; and the audience responds: "No, it is pretty!"

[708]

[123] This politeness is not always without malice, and compliments sometimes hide attempts at mockery. We cited above the formula used by a group to depreciate their dances in comparison to those of their companions they have just met; (1) but a few hours earlier, disdaining a present of beads

157
521
576

1. Cf. p. 92.

which I offered and which were not much appreciated because of their color, they advised me:

65. mpãtin maimaĩndẽ tunuhĩnde (b1)
Keep them to give to the Maimandẽ.

One day we were sold poison tubes (by group a2) described as so dangerous that we should abstain from ever opening them under pain of immediate death. They proved to be empty, which testifies to great ingenuity if the mystery was improvised on our account. In any case, it throws a curious light on the relationships between neighboring groups.

439
799
157

776 under the ground from where *oklihdítisu*, the culture hero, once released them. They add that they expect this to happen some day.

756 The man who is responsible for guarding the band against evil spirits is the shaman (*wanígidisu*).
775 In this task he is assisted by the ghosts of dead shamans of his own band. The spirit or ghost of a dead shaman is known as *anúnsu* and is sharply distinguished from the ghosts of non-shamans (*ayánkudisu*). The *anúnsu* of other bands, however, are considered evil for they bring thunderstorms. When speaking about shamans and shaman spirits in Portuguese, the Nambicuara refer to both as "trovão" (thunder). This has led many observers to the conclusion that the Nambicuara believe in a thunder spirit. Among the Wakítisu, at least, "trovão" or thunder is nothing more than a shaman or a shaman spirit. Actual thunder, which is caused by a shaman spirit is called *tlídisu*. A shaman spirit may also enter the body of a jaguar (*yendru*), and cause harm to people.

821 The Nambicuara do not like heavy and prolonged rainstorms, for they say that the winds blow down their houses, the lightning sometimes kills people, and the rains wash away the tracks so that they and their dogs have difficulty in
756 following game. To pacify the evil *anúnsu*, who has caused the storm, the shaman makes a cigar-
●789 shaped bundle (*yakúdenánsu*) out of certain dry leaves, which he ties with cotton twine, leaving long tails at each end. When he wants to stop the rain he lights one end of the bundle, and as it begins to smoke he waves it in the direction of the storm, telling the rain to go away. "Go away, go away, don't be angry at me," he says as he waves the bundle four times. If this does not stop the rain the shaman takes the sword club (*kalúnkisu*), which appears to have magical powers, and cuts the rain. If the rain still persists, he lights three smudges made by mixing "para toda" leaves with the *yakúdenánsu* leaves. When the smoke rises from the smudges he takes a burning brand and waves it against the storm telling it to stop.

756 The shamans of one band also practice sorcery
754 against individuals in another band by asking their *anúnsu* to inject objects into their bodies. When a shaman wishes to inject an object into his enemy he retires into a special hut (*sihdentsu*) and

[p. 125]

He was completely naked, that is, divested of his
756 necklaces, bracelets, earrings, and belt, and by the light of our
[301] electric lamps we could make out his tragic expression and his pale complexion. He let himself be helped to the camp without difficulty, where he sat down without a word and in a completely impressive attitude of dejection. Little by little, his story was drawn from him by an anxious listener. He explained that he had been carried off by the thunder (amɔ̃), [a storm had broken the same day]; the thunder had carried him in the air to a point which he designated at a distance of 25 kilometers from the camp (Ananáz River), had divested him of all his ornaments, then brought him back the same way and left him in the place where we had discovered him exhausted. Everyone went to sleep commenting on the incident and the next morning, C20 had recovered not only his habitual good humor, but also all his ornaments, which amazed no one and for which he offered no explanation. But the following days a very different version of the event began to be peddled by the Tarundé. They said that, far from having entered into relationship with the other world, C20, under the cover of a magical disappearance, had gone to undertake
[578] some transactions with a band of Sabané Indians who were camping in the vicinity. These insinuations were never developed further, and the official version of the affair continued to be ostensibly admitted. However, in our personal relationships, B1 let his preoccupations be seen upon several occasions. As the two groups left us shortly after, we never found out the outcome of the story.

756 No information has been uncovered concerning the manner of
278 naming the shaman as such. In the preparation of the arrow poison, C20 was assisted by his potential son-in-law C25.

* * * * * *

622 [104] Besides his supernatural attributes, the chief, or shaman,
756 plays another role, that of "leader" in ceremonies and celebrations.
●796 The Nambikwara have three types of ceremonies. Those which mark the critical moments of each one's existence, such as birth, initiation, puberty, marriage, death; the seasonal festivals; and finally, the ceremonies celebrated on exceptional occasions: war and hunting or scavenging expeditions. We have already alluded to the rites of war, and we shall speak farther on of the ceremonies of the first type. We shall limit ourselves here then to some brief observations concerning the others.

●796 The seasonal celebrations take place at the beginning and end of the rainy season, and probably mark the opening and closing of agricultural labor. They consist of festivals with dancing, singing and music. Several days in advance, hunting expeditions go in
[226] search of small game, and they also go in for large fishing expeditions. In fact, fish seems to play a role of the first rank in the ritualistic
796 534 activities. (1) Other Indians leave, sometimes for far-off places in

1. See below, p. 109.

[B24] order to find thick bamboo in the forests which border the rivers or which occupy the valleys, from which they cut pieces to make the flageolets for the ritual. These are about 70 centimeters long and pierced by four holes besides the one for blowing. An air passage is effected at the upper end in the mouthpiece of wax which closes the opening. They are only used upon occasion of these ceremonies and are played in unison in groups of three, one of them, engraved with a white longitudinal line, being named iomõte yilikãde, (chief flageolet), and played by the chief. A resonator made from a bamboo trunk furnished at the lower end with a hollowed-out gourd usually accompanies them (dutʔande, b1). The flageolets are called "male" and the resonators "female." Quite curiously, these flageolets are called iomõte (b1/2) and iamakaʃ (c), by the central, northern and southern groups, that is from the same term (iamakaʃ) by which the Paressi name the same instrument, while the eastern groups, who are the only immediate neighbors of the Paressi, employ a completely different term: kaigetasu (a 1/2). The Indians describe these festivals thus:

796 45. ukuerige ãidnige iuarhaidne ungʔrage (haidʔne) ãinsurgerage
to hide to blow to play [the flageolet] to make merry fishing.

nahundage tãtige niyattahãrige kãde kãde kãde kã ãitendige
to carry to roast to make chicha moon moon moon this moon to dance

iukuohãindige mihãdage komiegerage
and another time to play [the following month] more rain everything is dry

[105] mĩãdage tutʔhaihaikuirige
the rain is finished let [the flutes?] be carried away

hãintendige halehãidnige denõ horãtige eieteende
to make the field feast the women are hidden they do not see it

●796

alãgena haĩtige (b1)
to sing in the place.

534 A very strict taboo rests on the flageolets. Only the adult
784 men can play them:

46. uĩtnore uĩtnia imaãgare.
Children do not know how to play the flageolet.

And the sight of the instruments is rigorously forbidden the women:

denaãtie iatjaeninĩnena ednaso jaĩneni (b1)
the women cannot see them, only the men see.

These flageolets are made in great secrecy, in the same place where they find suitable bamboo. If the musical expedition returns by day, they hide the flageolets in the branches of a tree not far from the camp or from the village. They only bring them out at night, at the moment of the concert, and the women must then retire to the huts or under the shelters, and hide their heads in
[688] their arms. If one of them violates the taboo, they claim she would be pursued by all the men and killed by blows of a stick. We did not have the chance to attend one of these festivals, but, as we desired to collect the musical repertory of the flageolets, we were able, with a certain amount of difficulty, to arrange it so that a mission was sent to find bamboo and make instruments for us (it was necessary to go about 15 kilometers). Having left in the morning, the group returned in the middle of the night, and until daylight we made music some distance from the camp in order to avoid all feminine indis-
[534] cretion. As each instrument sounds a little different from the others, the playing produces an illusion of harmony which is added to the charm of the melody, in itself very real.

534 It is possible that all the musical instruments of the Nambikwara
789 are connected to activities of an economic-social character. Some testimonials, a decisive confirmation of which I was not able to obtain, present the nasal flutes (araãtasu, a2) as meant to assure a rich harvest of the fruit piquy. The season of piquy, which grows in
[222] abundance in the plains, is actually an impatiently awaited period for the Indians. The fruit is admiringly weighed and said to have "lots of fat." Likewise the flutes of Pan (asinzu, a1; juauzere, b1) would be employed in the rites preceding hunting expeditions. In
[192] the case of nasal flutes, a double analogy has been pointed out by certain informants between their form and that [106] of the pit of the piquy, and between their name and the name of the piquy (aharu, a 1/2). The latter analogy exists only in the eastern dialect

of the Beyond, and condemned to nothingness after death like non-initiated babies. We have described the tender companionship which presides in the relationships between the sexes, and the general harmony which reigns within the groups. But when these are altered, it is to give way to the most extreme solutions, poisoning and murder. It is quite reasonable for the informants to underline spontaneously the role of forgetfulness in funeral rites. (3)

157
562

3. P. 112.

For there is a striking contrast between the joyous irony with which one answers someone who is ignorant enough to inquire about a relative deceased for quite awhile: "iluftu, iluetu" (a1), "to the sand! in the sand!," and the horrible apparition of the atatu which is evoked with ritual sobbing.

Nambikwara rites do not seem to be symbolic in any way. The skeleton-like state of A21 and a22 at the end of the period of abstinence testifies to that, and although ceremonies are rare, they are carried far. The informants speak of periods of three months for the isolation of the young girl entering puberty, and of a bath in the river lasting a whole night as a preliminary to marriage. However much behavior is supple and without complication in daily life, likewise intrusions of the supernatural (in visions and revelations, the séances of shamanism, war dances, etc.) are manifested by the transition to an atmosphere of tragedy. No South American group, to our knowledge, expresses in such a sincere and spontaneous way (for one never feels the theatrical atmosphere of Tupi or chaqueno shamanism) such violent and opposed sentiments, whose individual expression seems inseparable from a social stylization which never betrays them.

796 ●

781

* * * * *

It is far from us to wish to assign an exclusively economic cause to this dualism. Nevertheless, it is astonishing to consider that the psychological dualism goes on an equal footing with the organization of social existence around [127] two opposite poles, on the one hand the sedentary life, agricultural, based on the dual masculine activity of the construction of huts and of gardening; on the other hand, the nomadic period, during which subsistence is principally assured by feminine collecting and gathering, the one representing alimentary security and well-being, the other chance and want. To these two ways of life, one followed in the winter, the other in the summer, the Nambikwara react in very different ways. They speak of the former with the melancholy which is attached to the conscious and resigned acceptance of the human condition, to the dull repetition of identical acts.

[157 797 177 648

The fact is that purely comical and sometimes childish appearances sometimes cover attitudes which, without being contradictory to the preceding, are nevertheless very different. The history of the eastern group, in the course of {124} these last years, is very significant in this regard. From 1909 to 1920, the installation of the telegraph line was marked by periodical conflicts alternating with cordial contacts, but in 1925, seven workers of the line were invited to visit (for the first time) the villages of the right bank of the Juruena River where we went later in 1938, and they disappeared there. From this time on, the contacts of the eastern group with the posts of the Rondon Line were interrupted, but in 1933 a Protestant mission was installed not far from the post on the Juruena. It seems that from the beginning relationships were quite strained, the Indians not being satisfied with the presents, very insufficient, they say, by which the missionaries paid for their help in the construction of the house and the planting of the garden. Whatever the case may have been, in 1933 a feverish Indian presented himself at the mission, and publicly received two capsules of "Cafiaspirin" which he took, after which he went to take a bath in the river, had a congestion and died. Through expert practitioners, the Nambikwara concluded that he

had been poisoned. An attack of reprisal was carefully prepared and took place, in the course of which A1 and A5 distinguished themselves. The six persons composing the mission were killed by beating or pierced with arrows, including a baby of two. Only one woman was found alive by an expedition sent to aid them from Cuiabá. The version which she gave of the events coincides exactly with that which we collected from the main protagonists of the other camp.

Poison was still to play a role in the life of A6, and this during our stay. We found ourselves visiting (August 1938) at the camp of a neighboring group (a2), and relationships became quickly strained between A6 and our hosts, undoubtedly over the question of women, so that he got the habit of coming to my camp to seek a more friendly atmosphere, at the same time that he shared my food. This fact was noticed, a delegation of four men came to find me one day, and in quite a menacing tone of voice told me to mix some poison (which they brought me along) in the next dish which I would offer to A6; they thought it advisable and indispensable to do away with him at once, for, they told me, he is "very wicked" (kakore) and "is worth nothing" (aidotiene). I had the greatest difficulty in getting rid of my visitors without opposing them with a refusal which in turn would have exposed me to animosity which I had just learned it was better to avoid, and I considered my best plan of action to exaggerate my ignorance of the language, and to feign obstinate lack of comprehension. After several attempts, my visitors retired very disappointed. I warned A6 who immediately disappeared. I was to see him again only four months later.

These incidents are characteristic of Nambikwara psychology. The Nambikwara are very open, confident and spontaneous, but they are very sensitive and react with great violence to deception [125] or disappointment. Few primitives are as easily accessible. Few give as free access to their intimate lives, to their beliefs, daily acts, thoughts and sentiments. But despite this facility and cordiality, the visitor, be he an ethnographer or a member of a neighboring tribe—must constantly be on guard and watch his actions; for the slightest imprudence, the least clumsiness, may incite reactions difficult to evaluate among his hosts, and in connection with which recent events are always present to recall that they may be extreme. A6 offered a perfect example of this confidence and spontaneity, allied with brusk manifestations of violence and irritability.

Thus, the Nambikwara character alternately presents two aspects, or more exactly, testifies to a double nature: one which we shall call positive, and which goes much farther in this sense than among many Indians in contact for centuries with the whites; and the other, of metaphysical nature, whose rigor and exaltation at times evoke the mysticism of the North

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

mules. During the height of the dry season in July his mules died of starvation, for during this period horses and mules must be given at least a pint of maize a day to keep them alive. Just before I left, the miner was willing to sell his emaciated oxen and equipment and leave. The best able to withstand the hardships are the missionaries who come as permanent settlers with adequate stores, put up their buildings, and plant small fields of manioc on the bottom lands.

A brief description of the approximately 400-mile truck journey from Cuiabá to Utiarity will provide the reader with an impression of this part of Mato Grosso. As no regular freight or passenger service exists north of Cuiabá it is necessary either to hire a truck or to wait until someone else plans a trip and to join the party. With gasoline costing one dollar (US$1) a gallon, trips of this length are beyond the means of merely inquisitive travelers, and even to anthropologists with expense accounts, charges of this nature may lead to embarrassing questions. Hearing that two American missionaries were negotiating a trip to Utiarity we joined them by paying a part of the expense.

Thus one afternoon Kaoro Onaga and I climbed on top of one of the two overloaded trucks and headed northwest. The trucks were owned by a Cuiabano nicknamed João Tapuya owing to his Indian ancestry. Being an owner of two trucks, he belonged to that class of people who believe it undignified to work with their hands. Each truck, therefore, had a driver and each driver had an assistant and two loaders; thus, besides the owner, there were 8 men to operate two trucks. Among the passengers, besides myself and my student, there were the two American missionaries, Rev. Lawrence W. Buckman and Rev. Robert Meader, Buckman's wife and 3-year-old son, two other women with children-in-arms, and some half dozen men headed for various points on the way. It was up to each person to find his place on the load and to make himself as comfortable as possible among the boxes, sacks, and sheets of corrugated iron, which, with each jolt on the rutted dirt road, shifted position.

That evening we arrived in Rosario some 90 miles north of Cuiabá. On entering the town we

[p. 82(c)]

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

old Paresí Indian village site on the west bank of the Papagaio. It is a division point in the telegraph line, and besides the telegraph operator there is a section boss and a number of Paresí Indian linemen. As the Nambicuara take whatever wire they feel they need, the linemen are kept busy repairing the line. There are 12 houses in the settlement proper with the buildings of the Protestant Mission forming one end of the town and the buildings of the Jesuit Mission forming the other.

[316]

The line boss, who is also the mayor of the town, gave Kaoro and me a two-room mud-and-wattle house as our quarters. Our meals we took with the two American missionary families. The Catholic Mission was under the charge of Father Roberto, a Frenchman, and Father João, an Austrian. In addition, there were three sisters in charge of a school. The priests had developed extensive fields of manioc and rice, irrigating the fields by diverting water from the river. They had also set up an electric-light plant, using water as a source of power. There are tremendous possibilities for power development, for Utiarity Falls, situated some half a mile distant, has a drop of about 240 feet. Unfortunately this power resource is located in a practically uninhabited, semiarid region.

7997
484

The Rev. L. W. Buckman, who has been in the area since 1941, kindly consented to prepare a pack train, using the mission oxen and mules, to go in search of the nearest band of Nambicuara. On the third day after our arrival when our preparations were well along, however, a band of Nambicuara came to Utiarity. In fact they were able to get a ride on João Tapuya's trucks as he was returning from Burity, the end of the truck road. This was Julio's band of some 18 people known by the Nambicuara as the Wakltisu. Their purpose was to bring one of their men who had running syphilis sores to the Jesuit Mission for treatment. This changed our plans, for we now had one of the four Eastern Nambicuara bands in camp, which would give us plenty to do for the limited period of our visit. Also during the first week, Father João returned from the Iranxe village, bringing five men, and offered to assist us in gathering whatever information we could get from them. This we found to be very difficult, as the Iranxe spoke no Portuguese and the mis-

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

Vilhena. These Indian Posts have had only limited success in attracting the Nambicuara, because the region is agriculturally so poor that it is difficult to grow enough food to maintain a settled population, and at present the Indians only visit these posts occasionally.

Intensive missionary activity among the Nambicuara began when two American Protestant missionaries, Arthur F. Tylee and William R. Henricks, established a mission station at Juruena in 1925. In October 1930, the Reverend Mr. Tylee, his baby daughter, Miss Mildred Kratz (nurse), and three Brazilians employed by the mission were killed by the Nambicuara belonging to Julio's band. Mrs. Tylee, although struck three or four times on the head while rushing to her child who was still in bed, was only stunned and came to after the Indians had left. One Brazilian hired man escaped to get help from the telegraph station. Some years later new Protestant missions were established at Campos Novos (Nambicuara) and at Utiarity. At present only the mission station at Utiarity is in operation.

The Jesuits established a mission at Juruena about 1930, but in 1940 moved it to its present site in Utiarity. Today both the Protestant and Catholic missions are, therefore, located in Utiarity, which not only is connected by truck road to Cuiabá but is also centrally located. To the east and south are the remnants of the Paresí, and to the north, the Iranxe, who, although not speaking the Paresí language, appear to belong to the Arawak-speaking family. Further northward are tribes with which the missionaries are planning to make contacts. To the west are the Nambicuara. Although officially on friendly terms there is considerable tension between the Protestant and Catholic missionaries, as they are competing for the allegiance of the same Indian population.

ECONOMY

Although the Nambicuara practice a shifting agriculture, their dependence upon the wild animal and plant life of the region is so extensive that they might well be classed as nomadic hunters and collectors. The semiarid plateau provides little in the way of agricultural land, game, or fish. What little farming is practiced is carried on in the narrow "galeria" forests of the headwater streams.

[p. 87 (N)]

648 only work for the white man when they want an ax, a knife, a gun, or some article of clothing, and once they obtain what they want they wander off. Miners particularly are bitter about the fact that the Nambicuara are unreliable workers.

797 Missionary activity, which has been carried on intensively by both Protestants and Catholics for about 20 years, has been singularly unsuccessful in Christianizing the Nambicuara. The Jesuit priests informed me that only those individuals who have been taken to Diamantino as children and kept there can be said to understand the rudiments of Christianity. The hope is that eventually these individuals can be brought back to the tribe and through their influence their children will be raised as Christians. The Protestants tell the same story. The Indians remain around the mission stations, participate in prayer meetings, and perform little tasks for which they are compensated but they soon become bored and wander off. The Rev. L. W. Buckman told me that he raised a Nambicuara boy at the station and believed that he would remain, but one day the boy got married, left with his wife, and took up the old wandering pagan form of life. None of the Wakítisu band are considered Christians. When Marciano died [764] a few days before I left he was buried according to Indian custom, both Protestant and Catholic missionaries participating in the burial as onlookers. Among this band which has had as much missionary contact as any, there was not a single individual who could speak or read Portuguese. Some of the men, as has been mentioned, used a form of pidgin Portuguese as a means of communicating with their white neighbors.

648 The attitude of the Nambicuara toward the white man is not only one of suspicion and sullen resentment, but one of disdain. They call white people "civilisados" or sometimes "bean eaters." A Nambicuara feels insulted if these terms are applied to himself. He openly boasts of being a "bugre," a slang term widely applied to Indians in Brazil which signifies a sodomite or heathen. While all other Indians that I have met in Mato Grosso objected to this term when it was applied to them, the Nambicuara always use it when talking about themselves. Julio informed me that the Nambicuara always get sick when they visit white people. The missionaries confirmed this fact but added that the Nambicuara have now become

/212 cont./

278 southern boundary of the territory of these Indians toward the
187 Amazon. Among the most remote Ñambikwara, those on the right bank of the Rio Juruena whose material culture is extremely poor and who do not have a sorcerer, all the men know how to prepare curare. Among the Tagnani living in the region of Campos Novos and the Rio October 12 and the Çabanè living between the campos of Vilhena and the Rio Commémoration, the preparation of curare is reserved either for the chief or more often for the sorcerer (Çabanè). The Tamandé of the Roosevelt River have refused to give any precise information on curare, the preparation of which is the exclusive prerogative of the sorcerer; their arrow poison, which I was able to study, is identical to that of the other groups. The Ñambikwara of the Cabixi River also use curare, but I did not obtain /213/ any details about its preparation from these Indians, who visited our camp but spent only one evening there.

278 I was present at the preparation of curare for the first time
126 among the Ñambikwara of the right bank of the Rio Juruena.
[114] Among the objects gathered for our collections were several poisoned arrows. The first experiments carried out on various animals either with the arrows or with the wash-water of the points revealed a symptomatology recalling that of curare.
[116] Our two chief informants, who were called José Maria and
[117] Julio by the civilized people, were influential personages in the group and the principal authors of the massacre of the North American, Protestant mission of the Juruena in 1930.
[123] Patient negotiations led them to show me the plant used by them, and then a little later, to let me be present at the preparation of the poison itself.

Not without fear of being hoaxed, I tested the prepared product: its action was identical in every respect to that of the arrow poisons. The Ñambikwara had been honest.

[114] Two months later in the campos of Vilhena the Çabanè
[162] sorcerer, who belonged to the mixed group composed of the

[115] THE NUMBERS

802 The Nambikwara have only three names for numbers, strictly speaking: one, two and many. But they are capable of composing these terms to form higher numbers by addition. We have thus been able to obtain countings up to 5, 6 and 8. To count "one" the Indians hold down with the left hand all the fingers of the right hand except the thumb. To count "two," they hold down the thumb, ring finger, and little finger, leaving up only the index and the middle finger. To count "three," they hold down all fingers except the ring finger. As a matter of fact, as no special word exists for this figure, "three" is no more than a unit added to two. In the central and southern dialect

●802 a special term ba is found, to designate a duo or a pair.

NAMES OF NUMBERS

Numbers	Dialects a 1/2.	Dialect b 1.	Dialect b 2.	Dialect c.
One.....	kənãge	nãgɔna, kanãkero	najukənada-ɾiaore	amero
Two.....	searu	nabaãm, baãdo	baãsore	balene
Three.....	nuneseare-kənage	nabãgɔna	uaĩnsore	balaãmero
Four.....	desanu	nabaɲõda	uaidnaĩsore	
Five.....	dasarenere	nmba-nmba-nagena	nikuãĩnsore	
Six.....	anere		uaĩdna-ãĩsore	
Seven.....	toãĩdenere			
Eight.....	uakesaũnĩnere			
Many.....	sãklaere	uãignine kuãintege	deindariĩsore	ãlele

[116] In the a 1/2 vocabulary, the terms indicated for "four" to "eight" probably represent less the names of the number than the descriptive terms of the operation which consists of adding a new unit to a whole. In the b2 vocabulary, the original word employed for "three" is apparently connected with the same origin as that of dialect b1 signifying plurality. The terms used for "four," "five" and "six" are probably descriptive of the manipulation.

[521] In conversation, the exclamatory forms are used, for example in discussions among men upon their return from hunting:

55. nãgɔnaarenĩani baãnenĩani baãnegɔrenĩani bãde-bãdenĩani baãkãkənaãnĩani. (b1)
"I killed one myself--two, myself--three, myself--four, myself--five, myself."

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

particular form of their own. Death is identified with these spirits. Men's souls are believed to be reincarnated as jaguars, whereas women's and children's souls are taken away by wind and thunder, never to return.

The highest being is the Thunder, with which any man, though usually a shaman, may have personal contact through revelations and visions. Women, however, except when very old, and children are deprived of these privileges. Women are also forbidden, under pain of death, to see the sacred flageolets (see Musical Instruments, p. 368) played at the ceremonies marking the beginning and the end of the dry season.

SHAMANISM AND MEDICINE

The shaman is sometimes distinct from—but more frequently identified with—the political chief. He is distinguished by having the privilege of polygyny, playing the leading role in ceremonial life, and possessing special supernatural powers. He treats patients by sucking out the disease or by fighting it with small ritual arrows called "thunder-arrows."

In addition to magical cures, the *Nambicuara* treat sickness with numerous medicinal plants, which are used externally or internally according to the disease. For eye infection, which is very frequent, they apply the infusion of a special bark with the help of a container made of leaves.

FOLKLORE, LORE, AND LEARNING

The only legend recorded by Lévi-Strauss (n.d. b) is a flood tale relating the destruction of human life and its re-creation through several incestuous marriages between the offspring of an old woman, who was the only being who escaped the disaster.

The only basic numbers used for counting are one and two, but the natives can reckon higher figures by combining these.

Colors are classified differently according to the dialects. The *Eastern, Central, Southern,* and *Western Nambicuara* agree in putting yellow and green in the same category, whereas the *Northern* group identify red and yellow, and class green, blue, and black together.

Some *Nambicuara* groups call stars by the same name which designates the spirits. The year is divided into two seasons and an undetermined number of lunar months. The day includes six main stages, each based on the position of the sun. Space is divided into two sections that are perpendicular to each other, one corresponding to the apparent movement of the sun and the other to the direction of the main waterways.

000 the Cocozu in circular pits, the Tagnani in elongated graves.

802 The concept of number is well under way among the Indians of the Serra do Norte. In their expressive manner, they count on their fingers and say "Dêra" for each unit.

802 When they have used up the fingers of both hands, if the num-
201 ber demands it, they lift a foot, repeating the same word, and then go on to the other foot.

A Tagnani chief who wanted to say that his people were already near and were bringing us manioc, maize, etc., in many baskets, having counted on all his fingers and toes, tapped the hands and feet of others present, repeating all the while, "Dêra, dêra, dêra" (this, this, this).

[805] To count the days, either past or future, which stand between them and a certain place, they raise their right hand to the face, rest their head on the palm, close their eyes, and produce a loud snore for every night to be counted.

822 The concepts of shape and area are also defined among them. The Cocozu call a circle irengcú, a triangle nendzu. Perhaps these words are merely names of animals or objects extended to cover these figures, which they trace accurately.

[Fig. 46]

821 They distinguish east and west. They indicate the approximate time of day by pointing out the place where the sun will stand on the horizon [260] at that particular hour. They do not seem to distinguish among constellations; they always gave the same name to any star we pointed out to them. The Tagnani indiscriminately named tangrê the Belt in the Orion constellation which they drew on the ground, as well as the largest stars in this exceptionally beautiful cluster (Rigel, Betelgeuse and Belatrix). The total eclipse of the sun which was clearly noticeable in the Serra do Norte on October 10, 1912, made no impression whatever on the Nambicuara.

000 As to the biological concepts they may perchance have gathered, we cannot yet speak about them. What we were able to ascertain did not satisfy us.

[Fig. 47]

197 The Indians of the Serra do Norte speak distinct but related dialects which are mutually intelligible.

KNOWLEDGE RELATIVE TO THE UNIVERSE

821 The Nambikwara of the eastern group call the stars ikitasu, atasu (supernatural animal) or inintu atasu; those of the central and southern group call them tãgare (classifying: -gare, that which hangs, decorates, trembles) and distinguish between "little stars," (tãganiuĭkare, -niuĭkare being a diminutive) and "planets" (tãgarare; classificatory: -are, full, swelled, liquid). No information could be gathered concerning the constellations. The sun is [118] called otianĭkisu, uterĭtisu (a 1/2), ũnde (b 1/2), iõta (c); the moon ĭru, irekisu (a 1/2), heinde, heĭtande (b 1/2), hiĭta (c), and they distinguish:

The full moon: arãditatinoa (a1), ejedamniene (b1) ipaĭkolota (c);

The moon in its (first or last) quarter: ãgiai²ĭnoa (a1), ejemirakende (b1), ipaĭkolo (c).

805 The year is divided into two periods: the rains (mihĭrage, b1), lasting approximately five months, and the dry season (komirige,

●805 b1) lasting seven months. The time is counted in moons and in nights, and the term moon or night is mentioned as many times as is necessary to arrive at the total of months (lunar), or of days, that one desires to mention. This enumeration gives a savory color to the language (cf. quotations 6 and 52): "hetende, hetende . . ." or kanadao, kanadao . ., etc. A source of confusion often comes from the fact that the Indian uses the term Ka (abbreviated from kanadero), "a single one," implying the period of time involved; one finds oneself thus faced with the enumeration "Kã, Kã, Kã ..." etc., without knowing whether it is a question of nights,or of one (moon) one (moon), etc.

They distinguish "today" (uẽidnekuare, b1) from "tomorrow" (kãnadaotrekuare, b1), from "yesterday" (kutnore, b1), and from "the day after tomorrow" (kãnaẽlaore, b1, = "still another night").

The day is divided into six phases (dialect b1);

The dawn: littenc, "it comes up" (the sun), naãninde, "it mounts";

9 o'clock: nĩkẽlaena, "it brightens";

Noon: nakakãtiore, "the bad hour";

15 o'clock: nĩẽditige, "it turns";

17 o'clock: kadeẽrgiena, "it falls";

Twilight: kanalũtere, "night comes."

823 The Nambikwara recognize four directions of space, two of which correspond to the axis of the apparent movement of the sun and two to the direction of the rivers, in effect approximately perpendicular to the preceding:

The north: ẽokẽnore, "toward bottom";

The south: ũkenore, "toward the top";

The west: ẽuingãtere, "the sun goes down";

The east: ẽunlirĩtere, "the sun comes up" (b1).

57. ndaorerilikãkate nejenã nejlikẽ (b1)
There is no other one, it is enough!

Territories are known and marked at distances extending 200 or 300 kilometers. Places, sources and courses of water have names, and the Indians (or at least some) are able to trace on the sand summary maps of travel with information as to the principal landmarks. Here is how A1 marks the stages of the trip of his group from the Papagaio River to the tributary of the right bank of the Juruena River where his village is located:

2: Lévi-Strauss E-5 (1938-1939)1948

particular form of their own. Death is identified with these spirits. Men's souls are believed to be reincarnated as jaguars, whereas women's and children's souls are taken away by wind and thunder, never to return.

The highest being is the Thunder, with which any man, though usually a shaman, may have personal contact through revelations and visions. Women, however, except when very old, and children are deprived of these privileges. Women are also forbidden, under pain of death, to see the sacred flageolets (see Musical Instruments, p. 368) played at the ceremonies marking the beginning and the end of the dry season.

SHAMANISM AND MEDICINE

The shaman is sometimes distinct from—but more frequently identified with—the political chief. He is distinguished by having the privilege of polygyny, playing the leading role in ceremonial life, and possessing special supernatural powers. He treats patients by sucking out the disease or by fighting it with small ritual arrows called "thunder-arrows."

In addition to magical cures, the *Nambicuara* treat sickness with numerous medicinal plants, which are used externally or internally according to the disease. For eye infection, which is very frequent, they apply the infusion of a special bark with the help of a container made of leaves.

FOLKLORE, LORE, AND LEARNING

The only legend recorded by Lévi-Strauss (n.d. b) is a flood tale relating the destruction of human life and its re-creation through several incestuous marriages between the offspring of an old woman, who was the only being who escaped the disaster.

The only basic numbers used for counting are one and two, but the natives can reckon higher figures by combining these.

Colors are classified differently according to the dialects. The *Eastern, Central, Southern,* and *Western Nambicuara* agree in putting yellow and green in the same category, whereas the *Northern* group identify red and yellow, and class green, blue, and black together.

Some *Nambicuara* groups call stars by the same name which designates the spirits. The year is divided into two seasons and an undetermined number of lunar months. The day includes six main stages, each based on the position of the sun. Space is divided into two sections that are perpendicular to each other, one corresponding to the apparent movement of the sun and the other to the direction of the main waterways.

headwater streams. The deep clear streams make fishing with timbó difficult. Game in the forests and on the plain is scarce. Yet by exploiting all the resources of the area the Nambicuara are able to survive. In contrast to the other tribes reported in this monograph the Nambicuara have the broadest resource base, as the list of their resources in Appendix 1 indicates.

The Eastern Nambicuara occupy the high plateau between Utiarity and Vilhena. At Utiarity the altitude is 442 meters and at Vilhena 665 meters. The dry season extends from May to September. Except for occasional south winds, which bring a cold drizzling rain for a day or two, the season is clear, cool, and dry, the daily temperatures ranging from 60° to 80° F. During this period the grass withers, the livestock of the white men having to subsist on shrubs and what fodder the owners can provide. Horses and mules, particularly, suffer during these months. In August the Indians burn the dry grass so that with the first showers new grass can grow out and attract the deer, which the Indians can then hunt.

The dry season, which the Nambicuara call *kwénkisu*, is the most difficult. By the end of June they have consumed the manioc, maize, beans, and other crops which they have planted. During July and August they subsist on palm nuts, combarú beans, fruta de lobo, snakes, insects, fish, and whatever animals they can kill on the plateau or in the forest. The rainy season (*wahíasu*) is divided into periods depending upon the fruits as they come into season. September is known as *yadédunsu*, for during this period the people depend upon the jaboticaba fruit. October and November are called *ya'awadjítsu*, for during these months the bacaba palm nut ripens. December and January are termed *dhru*, or piqui time. February and March are known as *casíru*, which appears to cover a variety of berries and small fruits. April and May are termed *daugadítsu*, as many fruits and nuts come into season, particularly, the cashew nut. During these months the garden crops also come in, giving the Nambicuara a short period of abundance.

SETTLEMENTS AND SHELTERS

Each of the four Eastern Nambicuara bands has a defined area within which it hunts, fishes, collects, and grows its crops. These territories in-

000 the Cocozu in circular pits, the Tagnani in elongated graves.

802 The concept of number is well under way among the Indians of the Serra do Norte. In their expressive manner, they count on their fingers and say "Dêra" for each unit.

802 201 When they have used up the fingers of both hands, if the number demands it, they lift a foot, repeating the same word, and then go on to the other foot.

A Tagnani chief who wanted to say that his people were already near and were bringing us manioc, maize, etc., in many baskets, having counted on all his fingers and toes, tapped the hands and feet of others present, repeating all the while, "Dêra, dêra, dêra" (this, this, this).

[805] To count the days, either past or future, which stand between them and a certain place, they raise their right hand to the face, rest their head on the palm, close their eyes, and produce a loud snore for every night to be counted.

822 The concepts of shape and area are also defined among them. The Cocozu call a circle irengçú, a triangle nendzu. Perhaps these words are merely names of animals or objects extended to cover these figures, which they trace accurately.

[Fig. 46]

821 They distinguish east and west. They indicate the approximate time of day by pointing out the place where the sun will stand on the horizon [260] at that particular hour. They do not seem to distinguish among constellations; they always gave the same name to any star we pointed out to them. The Tagnani indiscriminately named tangré the Belt in the Orion constellation which they drew on the ground, as well as the largest stars in this exceptionally beautiful cluster (Rigel, Betelgeuse and Belatrix). The total eclipse of the sun which was clearly noticeable in the Serra do Norte on October 10, 1912, made no impression whatever on the Nambicuara.

000 As to the biological concepts they may perchance have gathered, we cannot yet speak about them. What we were able to ascertain did not satisfy us.

423 garden, with the stipulation, of [113] a psychological and moral order, that one wait to take possession until "the memory of the dead [428 has been lost." However, this semijudicial means of acquiring 425] land does not imply the existence of an inheritance right. The relatives are not favored, and anybody can avail oneself of the same title.

GENERAL PSYCHOLOGY AND DAILY LIFE

The Categories

128 The linguistic study of the Nambikwara should be the object of special publications, (1) and we shall thus content ourselves

> 1. C. Lévi-Strauss, Sur certaines similarités, etc., loc. cit.; Paul L. Garvin, Esquisse du Système, etc., loc. cit.

here with several summary pieces of information destined to bring into sharper focus what can be inferred concerning the broad logical categories of thought, and to assign a place to the Nambikwara group within the orbit of other American cultures.

193 The most remarkable trait of the Nambikwara language, 197 made particularly evident by the central and southern dialect (b1), ●811 is an extended use of the classificatory suffixes. The systematic character of the classification of things and beings is comparable only to that found in the Ŝibŝa linguistic family. Furthermore, if one ignores several secondary differences, the division of the world into categories in Nambikwara presents a remarkable similarity with that found in the Ŝibŝa dialects. (2)

> 2. The following examples are borrowed from Walter Lehmann, Zentral-Amerika, 2 vols., Berlin, 1920, I, pp. 277-279, 404, 440, 454, 571.

In the division of things and beings into eleven principal logical categories, ten are found to be common to the Nambikwara and to the Ŝibŝa. The category "season, weather, sky" seems to be broken up, in Nambikwara, into several suffixes. Inversely, the same suffix-are classes two categories logically related but distinguished by

193 their suffixes in Ŝibṣa: —nak (Bribri), "excretion, secretion, resin"
197 and -dio, -rio (Bribri), "secretion, damp." (3)
●811

3. There would be, naturally, a large number of detailed observations to present. In the different languages, the logical categories partially overlap; thus, the Nambikwara category -kere corresponds partially to the Bribri -kal, and at the same time to -Xkuo. The suffix -kere expresses resistance largely, and the suffix -kate, which we have connected with it, form.

The phonetic analogies which occasionally appear between the classifying suffixes of the Nambikwara and the Ŝibṣa do not seem to us of great importance. On the other hand, morphological analogy, and above all the division of things and beings into classes which are not imposed on the mind [114] by any internal necessity, do not seem to us to be logically the result of a pure phenomenon of convergence. We see there, on the contrary, sufficient reason to affirm a linguistic affinity between the Ŝibṣa and Nambikwara groups. (1)

1. In his book Durch Central-Brasilien, Von den Steinen had already suggested the constitution of a linguistic area extending from Colombia to northern Bolivia by a chart of the northern and western distribution of the word sisi (sun, fire). The term sisi can be approximated in Nambikwara: siisu (a1), siise (b1): round hut, circle.

[115] THE NUMBERS

802 The Nambikwara have only three names for numbers, strictly speaking: one, two and many. But they are capable of composing these terms to form higher numbers by addition. We have thus been able to obtain countings up to 5, 6 and 8. To count "one" the Indians hold down with the left hand all the fingers of the right hand except the thumb. To count "two," they hold down the thumb, ring finger, and little finger, leaving up only the index and the middle finger. To count "three," they hold down all fingers except the ring finger. As a matter of fact, as no special word exists for this figure, "three" is no more than a unit added to two. In the central and southern dialect

Commissão Rondón, 1911 and later; Lévi-Strauss, 1943 a, b, n.d. b; Rondón, 1916; Roosevelt, 1924; Roquette-Pinto, 1912 a (1935, 1938), b, c, 1917; Schmidt, 1929 b; Schuller, 1912, 1921; Souza, A. P. de, 1920; Vellard, 1939 b.

627 The chief admon-
[622] ishes quarrelsome individuals but appears to have no powers of coercion. The Wakĺítisu claim that individuals quarrel but they do not fight among themselves nor do they remember any cases of murder. Unwanted individuals are exiled by common agreement. Houses, fields, and some implements are common property, and food is shared among the members of the band. Axes, machetes, and knives, although owned by individuals are freely used by other members. At death, privately owned tools pass to a man's sons or to his brother. The bow is customarily broken and left on the grave. Even these rules are not strictly adhered to, for when a man becomes seriously ill other men begin to help themselves to his property and the one with the "strongest mouth" gets the most. If the man recovers he cannot reclaim his things but must set about accumulating a new supply.

421

[428]

[764]

593 The wife and the children are under the strict control of the husband. Although boys must obey their fathers they owe no special obedience to their mothers. Boys sometimes throw stones and sticks at their mothers and the old women; the older men not only laugh but even encourage this disobedience. The bond between brothers is very close. On occasion they share each other's wives. No particular respect is paid to in-laws.

[837]

RELIGIOUS BELIEFS AND PRACTICES

774 According to the Wakĺítisu the spirits are the source of all danger, misfortune, sickness, and death. The ghosts of the dead (*ayánkadisu*), bring sickness unless offerings of food are made to them. The ghosts of dead shamans (*anúnsu*), belonging to other bands bring thunderstorms which destroy gardens and make hunting difficult. In addition to the ghosts, there is *tauptú*, the hawk of death who lives in the sky, and *ulurú*, the evil armadillo who lives under the ground and wants to destroy the villages and camps of the Nambicuara.

[782

753

[821]

776

Tauptú is an enormous hawk with huge wings, tail, and claws, who sits in a tree made of human bones. This tree (*lálukatsu*) is situated on the shore of a shallow lake in the sky. Shooting stars are caused by *tauptú* defecating at night. A small red bird (*dintnuwa*), who lives with *tauptú*, urinates into the lake and when it fills up the urine overflows and comes down in the form of rain.

[821]

[p. 99 (B)]

776 [753] *Tauptá* does not cause illness, but when people get sick he begins to eat away the flesh and finally kills them and eventually takes their bones to his abode in the sky. The missionaries told me that when the first airplane appeared in Nambicuara territory the Indians ran into the forest and hid because they believed the airplane was *tauptá*. Shamans sometimes visit the land of *tauptá* by riding up to the sky on the back of [756] *wutsi*, the night hawk or goat sucker. Julio claimed that his father-in-law, who was a powerful shaman, had visited the realm of *tauptá* while in a trance.

776 The Wakítisu fear most of all the spirit armadillo called *ulurú*. When someone sees bits of 756 manioc cake and charcoal floating on the river near the village, he comes back and tells the shaman, who then goes to examine the signs. If the shaman decides that it is *ulurú*, immediate action must be taken to save the world from destruction. The women and children shut themselves in their huts while the men take their wooden sword clubs (*hulúkisu*) and go to the bank of the river. The shaman then digs a deep hole in the bank, into which he is lowered with a rope. When he has grasped *ulurú* by the tail he signals the men on the surface to pull him out. The shaman remains at the mouth of the hole with his arm thrust in, holding *ulurú* by the tail while with his other hand he marks points on the ground which are directly over the head, heart, and stomach of *ulurú*. One by one the men thrust their sword clubs into the ground at the places marked by the shaman. As they push the blades in they twist them to make sure that they kill *ulurú*. After the spirit armadillo has been killed, the men go back to the village leaving the shaman alone with the dead *ulurú*. The shaman then cuts up the spirit armadillo, washes the pieces in the river, and begins to sing. When the ghosts of the dead Nambicuara hear the song they come and eat the pieces prepared by the shaman, after which they go away happy because the Nambicuara have been saved.

776 The Wakítisu say that if they should ever fail to kill *ulurú*, a terrific storm would appear followed ● [821] by an earthquake, for when *ulurú* gets under the village he will turn the world upside down, *tauptá* will fall down from the sky, and the Nambicuara will be buried again. In short, they will go back

776 under the ground from where *ekíkdítiu*, the culture hero, once released them. They add that they expect this to happen some day.

756 The man who is responsible for guarding the band against evil spirits is the shaman (*wanágidiu*).
775 In this task he is assisted by the ghosts of dead shamans of his own band. The spirit or ghost of a dead shaman is known as *anánau* and is sharply distinguished from the ghosts of non-shamans (*apúkudiu*). The *anánau* of other bands, however, are considered evil for they bring thunderstorms. When speaking about shamans and shaman spirits in Portuguese, the Nambicuara refer to both as "trovão" (thunder). This has led many observers to the conclusion that the Nambicuara believe in a thunder spirit. Among the Wakítisu, at least, "trovão" or thunder is nothing more than a shaman or a shaman spirit. Actual thunder, which is caused by a shaman spirit is called *tídiu*. A shaman spirit may also enter the body of a jaguar (*yenáru*), and cause harm to people.

●821 The Nambicuara do not like heavy and prolonged rainstorms, for they say that the winds blow down their houses, the lightning sometimes kills people, and the rains wash away the tracks so that they and their dogs have difficulty in
756 following game. To pacify the evil *anánau*, who
789 has caused the storm, the shaman makes a cigar-shaped bundle (*yakúdenánau*) out of certain dry leaves, which he ties with cotton twine, leaving long tails at each end. When he wants to stop the rain he lights one end of the bundle, and as it begins to smoke he waves it in the direction of the storm, telling the rain to go away. "Go away, go away, don't be angry at me," he says as he waves the bundle four times. If this does not stop the rain the shaman takes the sword club (*kalánkiu*), which appears to have magical powers, and cuts the rain. If the rain still persists, he lights three smudges made by mixing "para toda" leaves with the *yakúdenánau* leaves. When the smoke rises from the smudges he takes a burning brand and waves it against the storm telling it to stop.

756 The shamans of one band also practice sorcery
754 against individuals in another band by asking their *anánau* to inject objects into their bodies. When a shaman wishes to inject an object into his enemy he retires into a special hut (*sikdenáru*) and

535 The circling began at seven o'clock in the evening, with continuous chanting. The girls, not once deviating from their course, left regular marks on the dusty ground which were clearly visible in the moonlight. They seemed always to step in the footprints of the first round. Midnight. Near the fires lit by every family, the old people slept; some muttered and poked the embers which gleamed like scattered rubies. Within the circle, perspiring, covered with dust, more dead than alive, we all joined in the chorus: "Tagnanî-i! Tagnanî-i! Tangrê!"

Thus it went on all night. Whenever one of us fled and repaired to his hammock, two or three big husky fellows would come talking volubly, and drive the deserter back to his place...

●[521] Unfortunately the words of those chants were not recorded. We only know the two words cited: tagnani, the name of the tribe, tangre, which means "star." Was this astrolatry? The three central figures of this dance, in the course of which stars were mentioned, brought to my mind [255] the beautiful constellation of Orion with its Três Marias ["Three Maries"--the Belt].

533 I recorded two Cocozu musical pieces which are rendered here [pp. 73-74]. Prof. Astolpho Tavares has transcribed them into musical notation.

[Fig. 34]

The scale [diapasão] of Nambicuara music is about half a tone lower than our normal scale.

The notes used in the recorded pieces are: do^1, mi^{2b}, fa^2, fa^2, sol^2, la^2. Neither re nor si appear.

The recorded pieces are in la flat major shifting to mi flat minor (Recording No. 1), and in mi minor (Recording No. 2).

The musical motifs develop in two-part time.

184 The Serra do Norte Indians present two distinct kinds of social organization. From this standpoint, the Tagnani and Tawite are more advanced than the Cocozu and Anunze.

593 The latter live under a patriarchal regime: the father rules the [511] family, which is often monogamous. The children, after puberty, start new families according to their own wishes [à vontade] and continue to revere their progenitors.

342 treated with great affection. The men are jealous of their wives, and
[83] the women take pride in being faithful. In this respect they are quite unlike their neighbors, the Paressi women...

832 The couples are always petting each other, and no caress seems
302 sweeter and more tender to the lover than the woman's fingers running through his hair. This is easy to understand, for the Nambicuara head swarms with vermin...

[Fig. 38]

585 According to reports of the soldier Gouveia, marriage is a simple ceremony. The man asks the father of his beloved for consent to the union. If the father agrees, he gives the bridegroom a bow and a sheaf of arrows, telling him that with these weapons he must support the family he is about to form. That is all.

851 To show that a boy is the son of a certain man, they use in
201 their innocence an expressive gesture: they join the thumb and index finger of the left hand, in the shape of a ring, around the right extended index finger. Then they tap the child and father on the shoulder, saying "Uéth!" (son).

888 They show great respect for old people and spare them all possible effort. When we returned from the village on the Urucau to the post on the Juina, they had us carry [258] on the bow of our saddles the baskets of two old men from the group that accompanied us in search of gifts. The young men and the women all carried their own atiçú and did not ask for help.

771 As to their religion, we know only that it is fetishistic. We know nothing of its cult or system, and even less of its dogma. [Fig. 33]

●521 The northern groups seem to be tending toward astrolatry. Once
[77] when I had threatened the moon and the stars with an arrow, poised ready on a strung bow, several Tagnani rose abruptly and halted my gesture, speaking very excitedly, scolding me, and taking the weapon away from me as if it were a sacrilege.

The Cocozu and Anunze threaten the storm with their weapons, waving their arms in all directions and cursing the rain in loud yells.

Sometimes, instead, the women climb on a termite nest where they let out puffs of smoke and throw ashes into the air to frighten the storm.

764 We do not know anything as yet about their funeral rites. It has been ascertained, however, that they do not cremate their dead and do not eat them. They bury them directly [259] in the ground--
the Cocozu in circular pits, the Tagnani in elongated graves.

000 the Cocozu in circular pits, the Tagnani in elongated graves.

802 The concept of number is well under way among the Indians of the Serra do Norte. In their expressive manner, they count on their fingers and say "Dêra" for each unit.

802 When they have used up the fingers of both hands, if the num-
201 ber demands it, they lift a foot, repeating the same word, and then go on to the other foot.

A Tagnani chief who wanted to say that his people were already near and were bringing us manioc, maize, etc., in many baskets, having counted on all his fingers and toes, tapped the hands and feet of others present, repeating all the while, "Dêra, dêra, dêra" (this, this, this).

[805] To count the days, either past or future, which stand between them and a certain place, they raise their right hand to the face, rest their head on the palm, close their eyes, and produce a loud snore for every night to be counted.

822 The concepts of shape and area are also defined among them. The Cocozu call a circle irengçú, a triangle nendzu. Perhaps these words are merely names of animals or objects extended to cover these figures, which they trace accurately.

[Fig. 46]

821 They distinguish east and west. They indicate the approximate time of day by pointing out the place where the sun will stand on the horizon [260] at that particular hour. They do not seem to distinguish among constellations; they always gave the same name to any star we pointed out to them. The Tagnani indiscriminately named tangrê the Belt in the Orion constellation which they drew on the ground, as well as the largest stars in this exceptionally beautiful cluster (Rigel, Betelgeuse and Belatrix). The total eclipse of the sun which was clearly noticeable in the Serra do Norte on October 10, 1912, made no impression whatever on the Nambicuara.

000 As to the biological concepts they may perchance have gathered, we cannot yet speak about them. What we were able to ascertain did not satisfy us.

[Fig. 47]

197 The Indians of the Serra do Norte speak distinct but related dialects which are mutually intelligible.

THE COLORS

●822 The differentiation of colors has been studied in eleven patterns for which we give the list of Indian terms below.

Groups a and b present common characteristics. They distinguish white, black, red, blue, and put yellow and green in a single category. (1) However, while group a extends that assimilation

[193 197 171]

1. The term which designates green and yellow affects the singular form of a reduplicative plural. This morphological aspect is found again in Ŝibŝa: Thus in Bribri, green = tspa-tspa, yellow = kŏlo-kŏlo; in Guatuso, yellow = mari-mari; in Rama, yellow = nugnugna, green blue = nrinnrinma. (Cf. Lehmann, loc. cit., I, p. 333, 394, 434, 435).

to yellow ocher, group b stops at clear yellow and classes yellow ocher with burnt sienna in the same category, designated by the term of dialect a1 for "black." (2) Group c distributes the colors in a very

[826]

2. In accord with the anthropological judgment of the Indians who do not distinguish themselves from the "whites" as "yellow," but as the "colored" from the "clear":

(56) ŋãi ʔaniena tãikedniena (b1)
You are fair (clear), I am dark.

different way: one same category unites the reds and the yellows (which furthermore suggests the scale of the tincture of urucu), while the blues are attached to green and black.

The most esteemed colors are white and black, undoubtedly because these are the colors of the ornaments made from pearly fragments of river shells and from the dark nuts of the palm tree. Then comes red, then yellow. Green and blue are not much liked. [117]

822 192

Colors	Dialect a 1	Dialect a 2	Dialect b 1/2	Dialect c

KNOWLEDGE RELATIVE TO THE UNIVERSE

821 The Nambikwara of the eastern group call the stars ikitasu, atasu (supernatural animal) or iuinitu atasu; those of the central and southern group call them tãgɔre (classifying: -gɔre, that which hangs, decorates, trembles) and distinguish between "little stars," (tãgɔniuɨ'kɔre, -niuɨ'kɔre being a diminutive) and "planets" (tãgɔrare; classificatory: -are, full, swelled, liquid). No information could be gathered concerning the constellations. The sun is [118] called otianɨ'kisu, uterɨ'tisu (a 1/2), ũnde (b 1/2), iɔta (c); the moon ɨ'ru, irekisu (a 1/2), helnde, heltɔnde (b 1/2), hiɨ'ta (c), and they distinguish:

The full moon: araditatinoa (a1), ejedamniene (b1) ipaɨkolota (c);

The moon in its (first or last) quarter: ãgiai²ɨnoa (a1), ejemirakende (b1), ipaɨkolo (c).

805 The year is divided into two periods: the rains (mihɨ'rage, b1), lasting approximately five months, and the dry season (kɔmirige,

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

particular form of their own. Death is identified with these spirits. Men's souls are believed to be reincarnated as jaguars, whereas women's and children's souls are taken away by wind and thunder, never to return.

The highest being is the Thunder, with which any man, though usually a shaman, may have personal contact through revelations and visions. Women, however, except when very old, and children are deprived of these privileges. Women are also forbidden, under pain of death, to see the sacred flageolets (see Musical Instruments, p. 368) played at the ceremonies marking the beginning and the end of the dry season.

SHAMANISM AND MEDICINE

The shaman is sometimes distinct from—but more frequently identified with—the political chief. He is distinguished by having the privilege of polygyny, playing the leading role in ceremonial life, and possessing special supernatural powers. He treats patients by sucking out the disease or by fighting it with small ritual arrows called "thunder-arrows."

In addition to magical cures, the *Nambicuara* treat sickness with numerous medicinal plants, which are used externally or internally according to the disease. For eye infection, which is very frequent, they apply the infusion of a special bark with the help of a container made of leaves.

FOLKLORE, LORE, AND LEARNING

The only legend recorded by Lévi-Strauss (n.d. b) is a flood tale relating the destruction of human life and its re-creation through several incestuous marriages between the offspring of an old woman, who was the only being who escaped the disaster.

The only basic numbers used for counting are one and two, but the natives can reckon higher figures by combining these.

Colors are classified differently according to the dialects. The *Eastern, Central, Southern,* and *Western Nambicuara* agree in putting yellow and green in the same category, whereas the *Northern* group identify red and yellow, and class green, blue, and black together.

Some *Nambicuara* groups call stars by the same name which designates the spirits. The year is divided into two seasons and an undetermined number of lunar months. The day includes six main stages, each based on the position of the sun. Space is divided into two sections that are perpendicular to each other, one corresponding to the apparent movement of the sun and the other to the direction of the main waterways.

piau [large minnow] -- Akurizê.
painted -- Uanuncê.
dove -- Tuizê.
pig -- Iakizê.

805 bl) lasting seven months. The time is counted in moons and in nights, and the term moon or night is mentioned as many times as is necessary to arrive at the total of months (lunar), or of days, that one desires to mention. This enumeration gives a savory color to the language (cf. quotations 6 and 52): "hetende, hetende . . ." or kanadao, kanadao . . , etc. A source of confusion often comes from the fact that the Indian uses the term Ka (abbreviated from kanadero), "a single one," implying the period of time involved; one finds oneself thus faced with the enumeration "Ka, Ka, Ka ..." etc., without knowing whether it is a question of nights,or of one (moon) one (moon), etc.

They distinguish "today" (uejdnekuare, bl) from "tomorrow" (kanadaorekuare, bl), from "yesterday" (kutnore, bl), and from "the day after tomorrow" (kanalalaore, bl, = "still another night").

The day is divided into six phases (dialect bl);

The dawn: littene, "it comes up" (the sun), naaninde, "it mounts";

9 o'clock: nikalaena, "it brightens";

Noon: nakakatiore, "the bad hour";

15 o'clock: nisedi'tige, "it turns";

17 o'clock: kadeʔrgiena, "it falls";

Twilight: kanalitere, "night comes."

● 823 The Nambikwara recognize four directions of space, two of which correspond to the axis of the apparent movement of the sun and two to the direction of the rivers, in effect approximately perpendicular to the preceding:

The north: jokanore, "toward bottom";

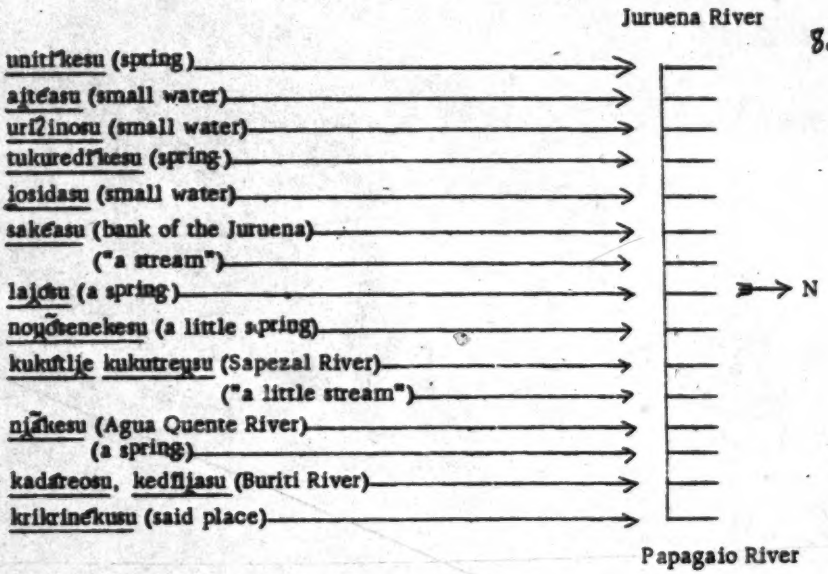
The south: ukenore, "toward the top";

The west: ʒuingatere, "the sun goes down";

The east: ʒunliritere, "the sun comes up" (bl).

57. ndaorerilikakate nejena nejlikẽ (bl)
There is no other one, it is enough!

Territories are known and marked at distances extending 200 or 300 kilometers. Places, sources and courses of water have names, and the Indians (or at least some) are able to trace on the sand summary maps of travel with information as to the principal landmarks. Here is how Al marks the stages of the trip of his group from the Papagaio River to the tributary of the right bank of the Juruena River where his village is located:



TRADITION

The Nambikwara have a sharp sense of tradition. We have read above (p. 50) a remark of B1 which shows him to be sadly cognizant of the decline of his race. Customs and techniques are generally considered as legacies of the "ancestors": 173 [183 829]

58. irotnore ikãtage nittige.
"The ancestors taught us how to coil it [the ribbon of rubber meant for making a ball]" (b1).

One single legend was found relating to the origin of the universe. [120] It is that of the Flood, the childrens' version of which we have already given. (1) Here is the text used by adults: 773 539

1. See above, p. 69.

of skill and initiative are the prerequisites of a good leader. It is he who makes the arrow-poison, although the preparation of *curare* among the Nambikuara is a purely profane activity surrounded by no ceremonial taboos or magic prescriptions. It is he, also, who makes the rubber ball used in the head-ball games which are played occasionally. The chief must be a good singer and dancer, a merrymaker always ready to cheer up the band and to brighten the dullness of daily life. This could easily lead to shamanism; and, in some cases, I have met with chiefs who were at the same time healers and trance addicts. Mystical life, however, is kept in the background among the Nambikuara, and, wherever they exist, magical functions are only secondary attributes of the leader. More often chieftainship and sorcery are divided between two different individuals. In this respect, there is a strong difference between the Nambikuara and their northwestern neighbors the Tupi-Kawahib among whom the chief is, first of all, a shaman, usually a psychotic addicted to dreams, visions, trances and impersonations.

But although they are oriented in a more positive direction, the Nambikuara chief's skill and ingenuity are none the less amazing. He must have a perfect knowledge of the territories haunted by his and other groups, be familiar with the hunting grounds, the location of fruit-bearing trees and the time of their ripening, have some idea of the itineraries followed by other bands, whether hostile or friendly. Therefore, he must travel more, and more quickly, than his people, have a good memory, and sometimes gamble his prestige on hazardous contacts with foreign and dangerous people. He is constantly engaged in some task of reconnoitering and exploring, and seems to flutter around his band rather than lead it.

Except for one or two men without actual power, but eager to cooperate and to receive occasional rewards, the passivity of the band makes a strong contrast with its dynamic leader. It seems as if the band, having relinquished certain advantages to the chief, were in exchange relying entirely upon him for its interests and safety. I received a particularly striking demonstration of this under rather strange circumstances. After several weeks' discussion, I had obtained from a chief the favor of taking me, together with a few companions and some animals loaded with presents, to the semi-permanent dwellings of his band which were uninhabited at that time. This was a chance for me to penetrate more deeply into the unexplored Nambikuara territory

For about seven
221 months these bands go wandering across the prairie in search of small
[222] game, small animals such as caterpillars, spiders, grasshoppers, rodents, snakes, lizards, and so forth, and fruits, grains, roots or wild honey—in short, all that might keep them from dying of hunger. Their camps, set up for one or several days, sometimes for several weeks, consist of as many temporary shelters as families, made of palms or branches stuck in a semi-circle in the sand and connected at the top. This is the period when the quest for food absorbs all activities. The women equip themselves with digging sticks, and
221 the men hunt with the bow and arrow, of which several types must be
411 distinguished. The eastern groups have a bow with a flat section
184 which evolves toward a convex-plane section or a concave-convex section when one moves westward. As for the arrows, those made for hunting birds have a blunted tip. Arrows for fish have three to five points, each one formed like a minute harpoon, and the stem is without barb. The poisoned arrows (1), whose tip is protected [15]

1. See below, p. 95.

by a sheath of bamboo, are reserved for hunting monkeys and small game. Those for large game have a long lanceolate point. The barb is attached or sewed on. Besides the bow and arrow, the men use a club
[789] which often takes the form of a javelin, and its use is reserved for magic and war operations (1).

1. Cf. below, p. 99.

● 824 The primary materials of the indigenous industry consist of varied
825 woods, wax from wild bees, resin, fibers of the buriti palm trees (Mauritia vinifera) and tucum (Astrocaryum tucuma) bone of the monkey, teeth and claws of mammals, fur (only to make ornaments), feathers, quills of porcupines, vegetable shells and river shells, stones,
412 cotton and grains. As implements they have knives made from a sharp piece of bamboo, from stones crudely fashioned, or from fragments of iron or steel obtained through exchange, and fixed with the aid of wax and cord between two pieces of wood forming the handle. Drills are made of a borer of stone or iron mounted at the end of a stick
[177] which they turn between their palms. The Rondon Commission expanded the use of axes and metal hammers, and the old stone axes serve now only as small anvil blocks for fashioning shell or bone.
[415] The use of stone polishers must also be mentioned and, among the objects of current usage, the spindles, combs, baskets and gourds to carry water.

carry water. Pottery, unknown to the eastern groups, is crude everywhere else. There are neither canoes nor dugouts. The Indians make five different types of musical instruments, all winds, which are often heard in festivals.

The difference in physical appearance between the Nambikwara and their eastern, western and southern neighbors—Paressi, Tupi-Kawahib and the tribes of the Guaporé—is striking. (2) And they

2. The anthropological study of the Nambikwara was the object of research of Dr. J.-A. Vellard, who was part of our expedition.

also differ from most of the other tribes of Brazil, whose physical type is generally more massive than theirs. In the case of the Nambikwara, the body is not exceptionally small; but they are slim, and their long hair, sometimes wavy and of more developed pilosity than the indigenous median, their hands and feet of reduced dimensions, their fine lineaments, and above all their faces, of characteristic outline but very purely chiseled, contribute to form a physical type far removed from that encountered most often in South America, but which reminds one persistently of certain types of southern Mexico and Guatemala, and even more of that characterized by the masks with pointed beards of the region of Vera Cruz.

* * * *

The Nambikwara get up at dawn, stir up the fires, warm themselves as well as they can after the cold of the night, then they eat lightly of the [16] remains of last evening's yucca cakes. A little later the men leave, together or separately, for a hunting expedition. The women remain in the camp where they devote themselves to culinary duties. The first bath is taken when the sun begins to come up. The women and children often bathe together for amusement, and sometimes a fire is lighted before which they crouch to warm themselves on coming out of the water while they playfully exaggerate a natural shivering. Other bathing takes place during the day. The daily occupations vary little. The preparation of food is that which requires the most care and time. Yucca must be ground and pressed, and the pulp dried and cooked. Or else the cumaru nuts (Dipteryx odorata) which add their perfume to most dishes must be shelled and boiled. When the need is felt, women and children go out on foraging expeditions. If the provisions are sufficient, the women spin, crouched

512 [516] on the ground in the position known by the name "aztec"—on their knees, the legs and feet flat on their inner side and the buttocks resting [306] on the heels. Or else they cut, polish and file beads from nut- [515] shells or sea shells, earrings or other ornaments. And if the work bores them, they pick the lice from one another, stroll around or sleep.

512 521 During the warmest hours the camp is silent. The inhabitants, silent or asleep, enjoy the uncertain shade of the shelters. The rest of the time, the occupations are carried on with animated conversations. Nearly always gay and laughing, the Indians exchange jokes, and sometimes, with unmistakable gestures, obscene or scatological accounts which are greeted with great shouts of laughter. The work is often interrupted by mutual visits or questions; when two dogs or birds copulate, everybody stops and contemplates the operation with fascinated interest; then work is taken up again, after an exchange of commentaries about this important happening.

512 The children lounge around during a great part of the day, the girls surrendering themselves at times to the same jobs as their elders, the boys idle or fishing along a stream of water. The men remaining in camp dedicate themselves to basketwork, making arrows and musical instruments, and sometimes to performing some small domestic service. Complete accord usually reigns within the household. Toward three or four o'clock, the other men return from the hunt, the camp becomes animated, the conversation becomes livelier, groups form, different from family agglomerations. They eat yucca cakes [262] and everything found during the day: fish, roots, wild honey, bats, ●824 little animals captured, and small sweet nuts from the palm bacaiuva (Acrocomia sp.). Sometimes a child begins to cry, quickly [855] consoled by an elder. When night falls some women, chosen daily, go to collect or cut down in the neighboring woods the store of wood 512 for the [17] night. They can be seen returning in the twilight, 313 staggering under the load which pulls the tumpline used for carrying 482 it. To unload, they crouch and lean backwards a little, letting their bundle of bamboo rest on the ground in order to disengage the tumpline from their forehead.

512 In a corner of the camp the branches are amassed and each one supplies himself in proportion to his needs. The family groups form around their respective fires which begin to glow. The evening is passed in conversation, or else in singing and dancing. Sometimes these distractions are prolonged far into the night, but in general, after some amusements of caressing and friendly fighting, the couples draw closer together, the mothers clutch their sleeping infants to them, everything becomes silent, and the cold night is

[86] LEADERSHIP

622 Each band recognizes the leadership of a chief (joheru, a1/2; uilikãde, b1/2; uelikapara, c). He commands the group, or more exactly the group of adult men who are his "companions" (nukanalore, b1/2). These see to it that the orders are carried out by their wives, who are rarely consulted. The women conform to the decisions of the men, but they do not, in the collective plane, execute them directly. They take part in this only inside their family group, within the limits of sexual division of labor such as we have previously described it. The tasks of the chief are diverse. The principal and most permanent consist of the administration of the group. It is the chief who decides the seasonal occupations at the beginning of the nomadic period,

27. uilikakamaniene ãitnaseneje (b1)
the chief commands: everybody on their way!

the moment and place where they will camp for the rains, the gardening work and choice of plantations, the construction of huts, the itineraries of trips and times of stopping, hunting expeditions, gathering or collecting trips, the conduct to be observed as regards neighboring groups. His role is generally summed up by the formula:

28. uilikã nãdana enate (b1)
the chief walks ahead. (1)

1. Thus, the philosophy of power does not seem to have been modified among the Brazilian Indians since the far-away day when, upon the occasion of an encounter made at Rouen, Montaigne made this statement: "Concerning what I asked him as to the fruits which he received from the superiority which he enjoyed among his people (for he was a Capitan and we sailors named him King), he told me that it was to be the first to march to war..." (Essais, éd. de la Pléiade, Paris, 1939, Ch. 31 "Des Cannibales").

[214] He also goes away much more frequently than his companions, for one or more days, accompanied by one or two of his polygamous wives who assist him in his enterprises, (2) with the purpose of

2. See above, p. 60 f.

discovering grains or fruits, [87] groves of piquy (a type of fir), of caju (Anacardium sylvestre), the heads of streams frequented by small game, where to lead his group, always searching for means of subsistence. His role is also that of maintaining internal discipline and of opposing the bad intentions of recalcitrants:

29. odnanjenuatonje hutento igalagatiene (bl)
Lazy one, I order you, that is enough, to work!

The only sanction at his disposition is that of obtaining the agreement of his companions to expell one who has become guilty of a fault (1) or who shows himself to be rebellious to collective life.

1. Cf. below, p. 111.

But that is only possible in the case where a single member of the group shows lack of discipline. The chief should show a continual talent which is more closely related to electoral politics than to the exercise of power, to maintain his group, and if possible, to enlarge it by new adherents. The nomadic band in fact represents a fragile unit. If the authority of the chief becomes too demanding, if he monopolizes too great a number of women, if he is not capable in periods of need of resolving the food problems, discontent is created, individuals or families break away, and go to attach themselves to a related band whose affairs seem to be better conducted—better nourished thanks to the discovery of a hunting or collecting site, or richer because of barter with neighboring groups, or more powerful after victorious wars. The chief then finds himself at the head of a too restricted group, incapable of facing daily difficulties, or whose women are exposed to being carried off by stronger neighbors, and he is obliged to renounce his command in order to join a more happy faction with his faithful followers; the Nambikwara society is thus in a state of perpetual flux. Groups form, are broken up, grow and disappear and, in several months' time sometimes the composition, number and division of bands become unrecognizable. All of these transformations are accompanied by intrigues and conflicts, by rises and falls, the whole being produced at an extremely rapid rhythm.

In exchange for the authority which they recognize in him, his companions are very demanding in regard to their chief; and if a decision made by him places the group in some difficulty, he is left alone to find means of surmounting it. We remember a trip undertaken by mutual consent, rendered more difficult than had been thought by the necessity of discovering a new itinerary along which our mules

278
[415]

p. 239 and Fig. 34), but seems not to know their usage nor the nature of their content.

usually tied in bundles of two or three or more, and thus all the Indians possess a provision of poison from which they rarely become separated. We were not able to find out anything concerning the preparation of these drugs, but it seems that different varieties exist, used either by men or women. Notably, the poisons whose small doses are contained in the feather quills would be [96] according to an informant, women's poisons, and also much more to be feared. The "tube poisons" (as compared with the arrow poison which is only employed for hunting, and never for war) play an important role in inter-individual relationships. They are the usual instrument for amorous or commercial vengeance. To define these poisons, there are special terms according to dialects. Thus the arrow poison has a special name: inãtu (a1); dãdnesu (a2); tiĩre, nãnde (b1); ãĩrare (b2); iriŋ̃ (c). But all of the arrow poisons and tube poisons are called by a more general term, belonging to dialect b1, but which is understood and used by all the groups: nãnde, which one might be wrongly tempted to translate as poison. It must be noted, however, from now on that in the case of tube poisons, the term nãnde means the tube and its contents simultaneously.

789 However besides these "true" poisons which we shall call scientific, there are other substances whose supposed action is of a purely magical character. Certain tubes contain, not a powder meant to be mixed with food, but fragments of resin of the tree called "barrigudo" or [824] "barrigudeira" in Portuguese (Bombax ventriculosa) and sahãtudĩtããru (a1/2), irĩdare (b1), jakĩ̃a (c) in Nambikwara. These fragments are used for certain "magic projections" which are carried out in the following way: a fragment of resin is placed between the lower edge of the palm of the left hand, held horizontally, and the tip of the index of the right hand held vertically (position called iuuehãre [a1]). By exercising strong pressure of the finger on the edge of the other hand, the index trips and throws the small projectile as far as several meters (asatãĩhedjuzu [a1], adãĩmdige [b1], ndãĩmdige [b2]). It is believed that the person reached by a fragment thrown in this way will become like the trunk of the barrigudo tree, narrow at the base and at the top and bloated in the center. He will fall ill, his stomach will begin to inflate, and finally he will die. This method of throwing is also often used for teasing, especially children, and to bombard an adversary with small fruit, with pieces of dirt,

796 The seasonal celebrations take place at the beginning and end of the rainy season, and probably mark the opening and closing of agricultural labor. They consist of festivals with dancing, singing and music. Several days in advance, hunting expeditions go in
[226] search of small game, and they also go in for large fishing expeditions. In fact, fish seems to play a role of the first rank in the ritualistic
796 activities. (1) Other Indians leave, sometimes for far-off places in
534

1. See below, p. 109.

[227] order to find thick bamboo in the forests which border the rivers or which occupy the valleys, from which they cut pieces to make the flageolets for the ritual. These are about 70 centimeters long and pierced by four holes besides the one for blowing. An air passage is effected at the upper end in the mouthpiece of wax which closes the opening. They are only used upon occasion of these ceremonies and are played in unison in groups of three, one of them, engraved with a white longitudinal line, being named iomõte yilikãde, (chief flageolet), and played by the chief. A resonator made from a bamboo trunk furnished at the lower end with a hollowed-out gourd usually accompanies them (dũnde, b1). The flageolets are called "male" and the resonators "female." Quite curiously, these flageolets are called iomõte (b1/2) and iamakã (c), by the central, northern and southern groups, that is from the same term (iamakã) by which the Paressi name the same instrument, while the eastern groups, who are the only immediate neighbors of the Paressi, employ a completely different term: kaigetãu (a 1/2). The Indians describe these festivals thus:

796 45. ukuẽrige ãdnige iuarhaidne ungãrage (hãidãne) ãinsurgerage
to hide to blow to play [the flageolet] to make merry fishing.

nahundage tãtige niuattahãtrige kãde kãde kãde kã aitẽndige
to carry to roast to make chicha moon moon moon this moon to dance

iukuohãndige mihãdage komiẽgerage
and another time to play [the following month] more rain everything is dry

[105] mĩãdage tutãhaihaikuitrige
the rain is finished let [the flutes?] be carried away

hãintendige halehãdnige denõ horãtige ejeteende
to make the field feast the women are hidden they do not see it

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

of skill and initiative are the prerequisites of a good leader. It is he who makes the arrow-poison, although the preparation of *curare* among the Nambikuara is a purely profane activity surrounded by no ceremonial taboos or magic prescriptions. It is he, also, who makes the rubber ball used in the head-ball games which are played occasionally. The chief must be a good singer and dancer, a merrymaker always ready to cheer up the band and to brighten the dullness of daily life. This could easily lead to shamanism; and, in some cases, I have met with chiefs who were at the same time healers and trance addicts. Mystical life, however, is kept in the background among the Nambikuara, and, wherever they exist, magical functions are only secondary attributes of the leader. More often chieftainship and sorcery are divided between two different individuals. In this respect, there is a strong difference between the Nambikuara and their northwestern neighbors the Tupi-Kawahib among whom the chief is, first of all, a shaman, usually a psychotic addicted to dreams, visions, trances and impersonations.

But although they are oriented in a more positive direction, the Nambikuara chief's skill and ingenuity are none the less amazing. He must have a perfect knowledge of the territories haunted by his and other groups, be familiar with the hunting grounds, the location of fruit-bearing trees and the time of their ripening, have some idea of the itineraries followed by other bands, whether hostile or friendly. Therefore, he must travel more, and more quickly, than his people, have a good memory, and sometimes gamble his prestige on hazardous contacts with foreign and dangerous people. He is constantly engaged in some task of reconnoitering and exploring, and seems to flutter around his band rather than lead it.

Except for one or two men without actual power, but eager to cooperate and to receive occasional rewards, the passivity of the band makes a strong contrast with its dynamic leader. It seems as if the band, having relinquished certain advantages to the chief, were in exchange relying entirely upon him for its interests and safety. I received a particularly striking demonstration of this under rather strange circumstances. After several weeks' discussion, I had obtained from a chief the favor of taking me, together with a few companions and some animals loaded with presents, to the semi-permanent dwellings of his band which were uninhabited at that time. This was a chance for me to penetrate more deeply into the unexplored Nambikuara territory

223 vanna, but they hunt for rhea eggs and the young birds.

224 When hunting caymans they do not use the word "cayman," nor will they take their eggs for fear of angering the mother cayman. After [535] a jaguar or tapir is killed the hunters sing and dance the following night.

Every group hunt has a hunt leader who is an experienced man. He tells each man exactly what he is to do. Hunting such animals as peccary, tapir, and jaguar demands careful teamwork. If the band splits up to hunt, the band chief will appoint the hunt leaders. If any man disobeys the hunt leader he will take the man's bow away from him and send him back to camp where he has to listen to the ridicule of the women. This is considered a great humiliation and happens only seldom and then to youths who are, as yet, inexperienced and overanxious to make a kill.

226 As the Nambicuara hunt along the banks of the rivers they are always ready to shoot any fish that happens to come near the bank. Sometimes they stand in one spot for hours waiting for pacú or matrinchã to pass near the bank. Certain berries which the fish like to eat are often thrown into the water to bring fish to the surface. At other times they tie a piece of broiled meat onto a stick and push the stick into the bottom. A man then stands on the bank, sucks air through his cupped hand, and as he lets the air out with a grunt he motions with his hand as if beckoning the fish to come near. This appears to be a magical act, for the Nambicuara claim that the fish understand the call. Sometimes they even talk to the fish saying that they have brought fat meat for them.

● [824] Timbó fishing is practiced in the shallow cutoffs of the main streams. First the pond is dammed off, then bundles of timbó vine (*kéatu*) are thrown into the shallow water and beaten with sticks until the vines are crushed, the bundles are then doused in the deeper water. As the fish in the ponds are very small, they are scooped up with baskets, either the cylindrical burden baskets or a shallow square basket. They also use a conical trap made on the spot from a few sticks which they thrust into the weeds where the fish are hiding. When they have finished with this trap (*tenáwa*) it is thrown away. Compared with the efficient equipment and methods in the Upper

4: Oberg E-5 (1949) 1953
SP17 Nambicuara SP17

subsistence activities. For instance, they say that they eat the blossoms of certain plants and a great number of grubs, larvae, and insects. A favorite dish is to crush in a mortar manioc cakes with boiled beans, broiled meat, ants, palm nuts, monkey and bird bones.

As an example of the variety of uses to which the Nambicuara can put a plant we can take the buriti palm: (1) They eat the pulp surrounding the scaly covered nut. (2) They use the fibers from the new growth to make twine. (3) They use the tough, flexible cortex of the frond stalk for making baskets. (4) They fell the buriti so that a certain variety of grub can collect and multiply in the starchy pith in the heart of the tree. The grube or larvae they then eat uncooked. (5) The dried frond stalks are tied into bundles and used as floats for crossing rivers. In addition, the buriti palm has male associations, for only men can prepare its products. When a male child dies a piece of buriti fiber is left over his grave.

The Nambicuara make fire by the drill method. They cut two round pieces of dry stick about 18 inches in length and three-quarters of an inch in diameter from some bush that has a soft pithy center. The lower stick is split and into the flat side shallow notches are cut to hold the drill in place. The drilling stick is then inserted into the notch while the lower stick is held in place by the toes of the man as he squats over it. He then begins to twirl the stick between his palms, pressing downward. As his hands reach the bottom, he quickly brings them to the top and continues drilling until the pith in the lower stick loosens into small smouldering balls. These he places into a handful of dry buriti fiber and begins to blow on them until the fiber ignites. About 2 minutes is all that is required to make a fire by this method.

MANUFACTURING

The material equipment of the Eastern Nambicuara is extremely simple. Many items, such as the conical trap for catching fish, the floats for crossing rivers, the loom for weaving arm bands, and the mortar and pestle for crushing food products are made for the occasion and are discarded when the task is completed or when the people move. The small grater and the few gourd vessels, small baskets, and twine, the woman carries

[p. 92(B)]

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

619 which cause sickness, they have given the magical herbs whose smoke blinds the dangerous *anúnsu*, and the techniques which will drive away the storms. Thus the shaman operating on a symbolic level continues the struggle for survival which has been defined for the Nambicuara by the nature of their adjustment to their physical environment and their relationships to one another.

THE LIFE CYCLE

BIRTH

833 The Nambicuara recognize sexual intercourse
[842] (*winsúenditsu*) as the cause of pregnancy (*haldjítsu*). This act takes place in the woods while the husband and wife are out hunting or collecting, for it is considered improper to have sexual intercourse in public, even at night around the common camp fire. If a shaman should see a couple in
756 sexual embrace while practicing his rites it would
833 spoil his power. Although shamans use a special hut when calling their *anúnsu* there is always a chance that they may see a couple in the sexual act, so every effort must be made to avoid this
[834] danger. Shamans themselves abstain from sexual intercourse for 2 or 3 days before getting in contact with the spirits.

843 There appear to be no food taboos surrounding pregnancy among the Waklítisu. The husband continues hunting and collecting as usual, but he must avoid working too hard in the field for
[847] fear of causing his wife to abort. Women do not practice abortion, and the Nambicuara did not mention any medicines used for this purpose.
[832] Honey is considered conducive to sexual vigor and is used by young couples. Childless marriages
[843 586] are attributed to sterility in women, and a man may abandon his wife for this reason.

844 Birth takes place in the house, or in the camp if the family is out hunting. Just before expecting
● [824] the birth of a child the expectant mother drinks the juice of certain herbs which are believed to facilitate birth. The husband and two older women assist in the delivery. The woman kneels on the ground and is supported by her husband. The umbilical cord is tied with a certain vine and then cut with a bamboo sliver. Among the Kitânrhu it is bitten off by one of the midwives. The placenta is buried at the place of birth and when the umbilical cord dries and falls off, it, too,

APPENDIX 1

RESOURCES OF THE NAMBICUARA

AGRICULTURAL FOOD PLANTS

241
824

Portuguese name	English name	Scientific name	Nambicuara name
Amendoim	Peanuts	*Arachis hypogaea*	Wálikisu.
Araruta	Arrowroot	*Maranta arundinacea*	Yalácsu.
Batata doce	Sweetpotatoes	*Ipomoea batatas*	Whu.
Cará		*Dioscorea* sp	Ha'kisu.
Fava	Beans	*Phaseolus lunatus*	Kwá'su.
Mandioca brava	Manios	*Manihot esculenta*	Walídnsu.
Milho	Maize	*Zea mays*	Kayátsu.

AGRICULTURAL NONFOOD PLANTS

Algodão	Cotton	*Gossypium* sp	Kéunsu.
Fumo	Tobacco	*Nicotiana tabacum*	E'tsu.
Cabaça	Gourd	*Lagenaria sicoraria*	Kad'd'hensu.
Urucú		*Bixa orellana*	D'unákasu.

WILD FOOD PLANTS (FRUITS)

137
824

Ananás	Pineapple	*Ananas comosus*	Kufáhu.
Babaçú		*Orbignya martiana*	Waisafkisu.
Bacaba		*Oenocarpus bacaba, distichus*	Wédnsu.
Bocaiuva		*Acrocomia eriocastha*	Haldnkisu.
Buriti (auta)		*Mauritia flexuosa; M. vinifera*	Héru.
Cajú-do-campo	Savanna cashew	*Anacardium nanum*	E'hru.
Cajú-do-mato	Forest cashew	*Anacardium gigantum*	Daunlfkisu.
Cumbaru		*Dipteryx odorata*	Najgisu.
Fruta-de-lobo		*Solanum lycocarpum*	Kónakisu.
Jaboticabeira	Jaboticaba tree	*Eugenia cauliflora*	Alhúnisu.
Mangabeira	Mangaba tree	*Hancornia speciosa*	Ehlkiálignsu.
Marmeleiro-do-campo	Quince tree	*Mouroucua brasiliensis*	Tkohlo.
Marmeleiro-de-espinho	do	do	Kad'l'kisu.
Marmeleiro	do	do	Wallikisu.
Marmeleiro	do	do	Halu'kisu.
Piquizeiro	Piqui tree	*Caryocar brasiliensis*	A'hru.
Petalas brancas de arbusto			Aldnyatsu.

WILD PLANTS USED IN MANUFACTURE

Buriti		*Mauritia flexuosa; M. vinifera*	Y6tsu.
Camaiuva		*Gnudus* sp	Kadfkatsu.
Cipó		*Philodendron imbe*	Kasdsu.
Piuva-da-mata (Paripari)		*Jacaranda copaia*	Hala'su.
Sapé		*Imperata brasiliensis, centrada*	Kaiekidansu.
Seringueira	Rubber tree	*Hevea brasiliensis*	Walfkatsu.

824]

FIG. 1.—ABANO DE FOLHA DE BACÁIBA.

[Bacáiba leaf fire-fan]

linguistico Gê, passarão os Nhambiquára a fazer parte da familia Aruak, onde já se encontram os seus vezinhos Parecís.

Na coleção etnografica recebida pelo Museu, enviada pelo Coronel Rondon, acham-se como substancias alimentares amostras de milho, feijões e de uma conserva de mandioca muito semelhante ao "Kêtâhê" dos Parecí. Existem tambem na coleção algumas amostras de breu indijena. E'massa negra que amolece e funde a temperatura muito baixa, adquirindo intenso brilho, e des prendendo cheiro rezinozo; parece que é uma mistura da rezina do Oanani (*Syphonia globulifera*), e cêra. O principal emprego dessa massa é a fixação dos cordões que ligam a ponta á haste das flechas.

Os artefactos dos Nhambiquára têm um certo valor. Para a confecção dos abanos uzam as folhas de bacáiba (Fig. 1), sendo os foliolos trançados em grupos de 4, dois

342 provided with a fairly large doorway; it could easily hold some twenty people. The other had the shape of a triangular prism, with one of its [lateral] faces to the ground. It was more carefully constructed, and measured nine meters in length, three and a half in width and two and a half in height. One of its ends was closed; on the side, hidden by the leaves which hung from the roof, there was a small door. The other end was fully open. The hut was oriented in an east-west direction, the closed end facing the east. Thus in the afternoon the rays of the sun entered the house for a few hours.

Two forked stakes, one at each end of the building, supported the ridgepole. [222] Several beams designed to hold the huge covering leaves of the babassu palm ran from the ridgepole to the ground.

The palms which were laid on one side of the roof were folded at the top over the ridgepole onto the other side; in order to hold [283 824] them in this position, two rods ran the length of the house, tied to the inner beams with knots of embira (1) cord.

1. A bast fiber yielded by one of the embira trees. (Ed.)

Tagnani and Tawite villages also consist of two huts. Each, with its entrance oriented in an east-west direction, is evenly circular at ground level and conical in shape. From the apex of the cone a pole rises a few spans above the roof; it is always forked at the tip, as shown in the photograph. The doorways are set on opposite sides of the building, facing each other.

We still do not know how the Nambicuara trace the circle which delimits the hut; it must be a freehand line, for that is how they draw this figure on their gourds. In the middle of the house they set up four stakes forked at the tip and a centrl support. [Fig. 16]

The forked stakes form an overhead rectangle of wood, from which flexible poles run down into the ground along the circle which delimits the house. These poles are secured and connected by horizontal rods which complete the framework of the hut. The covering consists of bacaba palm leaves arranged in layers. As seen from within the hut, the first layer consists of plaited leaflets fastened to the [223] woodwork. [Plate p. 226]

513 At the post of Três Buritis, where they camped with us for a few days, they disputed every night the occupancy of a crude wooden table where the station personnel ate their meals; they already appreciated our habit of sleeping above the ground.

Why, then, did they not make use of the hammocks? Because they were not familiar with it.

[248 824] They are capable of plaiting cotton and tucum (1) thread more

1. Bactris setosa (Ed.).

than adequately enough to make a hammock; and they are also capable of appreciating their neighbor's hammock, as indeed they do now.

This ethnographic trait attests to the inferior position of the Serra do Norte Indians.

[171] [228] This unfamiliarity [with the hammock] is in fact characteristic of the large Ge-Botocudo group of Brazil, which in the consensus of all who have studied it comprises the most backward aborigines in the Americas.

All Serra do Norte Indians sleep directly upon the earth. They spread nothing in the way of leaves, straw, pallets or hides between themselves and the ground.

They nearly always rest on their side, pillowing the head on the forearm.

516 The men rarely sit directly on the ground; they usually squat. The women do the reverse. If standing in one spot for more than a few minutes, a man will usually flex one leg and rest his foot against the other knee; the women assume a characteristic posture which I have never seen described and which is clearly shown on the photographs we took.

They cross their thighs, thrusting the right part of the pelvis forward and the left part forcibly backward. The longitudinal axis of the right foot, if extended, cuts that of the left foot almost at a right angle.

They frequently cross their arms.

201 When excited or roused by happiness or fear, they repeatedly slap the back of their head with their open right hand. When displeased, they make the same gesture while exclaiming: "Ikátnerá!"

252 The Cocozu do not use a barbecue; they roast their meat in the embers. The quantity of ashes they swallow with the roast is considerable.

[Plates p. 230.]

[231] The Tagnani and Tawite build a characteristic type of barbecue. They set up four stakes which they connect with four crosspieces; between these they place two sticks to hold the pieces of meat.

[Fig. 23]

[272] They drink honey mixed with water (hydromel). They like
262 young bees, which they eat with the honey and wax.

They do not allow the maize to ripen, but eat it roasted when
252 still green. Manioc is subjected to the same process, or it is used in grated form to make cakes [beiju].

They press the gratings with embira cord and prepare very white pellets with the starch. To make the cakes, they open a cavity in the hot ashes of the fire and deposit in it a pellet of manioc dough which they smooth out with some piece of wood and with their hands. Then they cover it with ashes and embers; after a period of time which we do not know how they estimate, they uncover a large, roasted, sweet-smelling cake, somewhat sour, but which would be rather pleasant if it were not so covered with ashes and if it had not been prepared by such an unclean process...

[262 824] Green mangaba, (1) no sooner seen, is immediately plucked

1. Fruit of the mangabeira (Hancornia speciosa). (Ed.)

and placed in the embers. When roasted, it turns tender and pleasing to the taste.

[262] From bacaba palm nuts the Tawite make a purplish mush (uidniarê) which tastes like green leaves and which they relish. In order to prepare this uid-niarê, they pound the fruit of the palm and place it in water over the fire. This is actually a decoction.

273 We did not have an opportunity to observe the preparation of any fermented liquids. Yet the Indians make alcoholic beverages by

273 the usual process: they masticate manioc or maize and allow the mush to ferment in large pots. One drink thus extracted from the wild pineapple was held in high regard by the personnel of the Telegraph Line.

[262] They are especially fond of monkey meat--a last vestige,
266 perhaps, of their former cannibalistic tastes.

I do not think that cannibalism still exists among them. But I believe that it has not been long since the habit was lost.

It is true, nevertheless, that they often accuse one another of this practice; they make such accusations in a perfectly clear manner, by means of unequivocal signs.

372 [233] They make fire by rubbing together two rods similar to those found elsewhere in Brazil.

This procedure takes much longer than might be expected.

The Indian begins by placing a dry leaf upon the ground; upon it he rests the "stationary fire stick," which he supports with his foot and knee.

[Fig. 26]

Holding the "movable fire stick" between the palms of his hands, he imparts to it the necessary rotary motion, bearing down with it at the same time against the other stick. This motion forces the hands downward along the rod; [when he gets to the bottom], the Indian starts again from the top. Now and then he stops briefly to lick his palm, which smarts from the friction. After a while, when sweat is already beading his forehead, a spark strikes up among the tinder which has been deposited on the leaf.

This process differs from the classical technique only by the presence of the protective leaf.

Because this procedure is laborious, the Indians carry it out with reluctance. Desirous of obtaining a film which would document all their routine activities, I had great difficulty in persuading an Indian to make fire. This is the reason why, of all gifts, matches are among those valued most highly; to make fire after their fashion on a rainy day or in humid weather is a hard and laborious task.

[262 SP4 184] The Tagnani and Tawite also eat a certain kind of mushroom (Polyphorus sp.) which the others disregard.

824 It is a curious fact that palm cabbage (palmito) is not utilized by the Serra do Norte Indians. Gabriel Soares [234] made it clear in 1587 that the aborigines of the coast prized the leaf buds of the palm tree: "Stupendous palm cabbages, five or six spans in length and as thick as a man's leg, are extracted from the buds of these palms."

273 Pineapple wine was a common beverage, for Soares goes on to say: "The nature of this fruit is hot and humid, and it is very harmful [278] to those with open wounds or sores; the same pineapples, when green [757] are good for curing sores, for their juice eats away all the rotten and putrid flesh, and the aborigines know this; in such wise does this fruit [296] eat away, that they use its rind to wipe off the rust from their swords and knives and to remove the stains from the clothes they wash; when ripe, the juice is used by the Indians to make a wine which inebriates them; to this end they pluck the fruit not quite ripe, on account of its being more sour..."

263 The Indians of the Serra do Norte found our salted food unpleasant. They often refused the plates we set before them, giving us to understand that it was the salty flavor which led them to behave in this manner.

262 Milk (condensed milk) was also rejected in the beginning; they would make a face and say that it was human milk and therefore repulsive: [235] "Anungçú!"

261 One must know the Indians' gluttony, their insatiable hunger, their continual, unfailing, artless, persistent animus devorandi, fully to comprehend the disgust which led them to such a renunciation.

262 The children are given to eat of everything; no matter what 855 goes into an Indian's mouth, there is always a crumb for the little one who walks beside him or rests in his arms.

276 Even the stimulants they use--tobacco, for instance--are shared 855 with the children. More than once I had the opportunity to observe Indians giving cigarettes to children under two. (1)

[113]

1. Cf. E. Roquette-Pinto, "A condição da criança entre os Indios do Brasil [The Status of the Child Among the Indians of Brazil," Primeiro Congresso Americano da Criança [First American Congress on Childhood] (Tucumán, 1916).

411 The bows of the Serra do Norte Indians (hukiçú) are made of
171 ipê (1) wood and are very long, measuring from 1.70 to two meters;

[824]

1. [In this region, the term covers] trees of the Tecoma and Jacaranda genuses, Bignonia family. The forest variety is J. copaia, D. Don; the field varieties comprise the yellow type (T. ochracea, Mart.) and the purple or black kind (T. ipê, Mart.). (A. J. de S.)

the section is semi-circular. Of all Brazilian tribes, only the Catukina of the Purus River coil the twine around the weapon in a similar way. The cross-section of the Catukina bow, however, is quadrangular.

[Fig. 54]

We made an experiment to determine the approximate strength required to lend a bow the necessary power.

The bow we used measured 2.38 [sic] meters in length by 0.047 meter in its greatest width; its tucum cord [268] had a diameter of 0.002 meter. To set in this bow a fifty-centimeter arrow required 66 kilograms of dynamometric traction.

The [Serra do Norte] Indians use the Mediterranean release (Morse's fourth method): bow vertical, arrow resting against the left edge of the bow and held at the base between the index and middle fingers of the right hand.

In the Americas, this method is peculiar to the Eskimo; the "Redskins" employed another. In Brazil, no [other] tribe uses it as far as I have been able to ascertain; [269] for the most part, our Indians use the third method outlined by Morse.

[269] [Brazilian bows fall into the following categories listed by Hermann Meyer: 1) Peruvian; 2) Northern Brazilian; (1) 3) Guiana;

1. Semi-circular cross-section; dark red, smooth wood of a leguminous tree.

411
278

experiment with the resinous, supposedly poisonous substance found on the tip of one of these arrows. He injected a concentrated solution of it into frogs and guinea pigs, and the only resulting symptoms were muscular twitchings, unsteady gait, and some salivation.]

[Fig. 60]

441 Aieraçú: The tip is blunt; it is used to stun birds that are to be caught alive or free from blood, which stains the feathers. [See fig. ... (59), p.55A] Often a smooth tip wrapped in a straw pellet is used for the same purpose.

[227] [274] Some unique fishing arrows have a double, triple or quadruple tip and a bone barb. [See fig. ... (37), p. 36B.] Some have feathers at the base, others do not. . . . .

All Serra do Norte arrows have shafts made of thin bamboo. The various parts of the weapon are secured with strips of the strong [824] imbé liana (Philodendron imbe, Mart.).

[Fig. 61] The clubs are extremely crude weapons of attack and defense, mere portions of thick branches cut when the occasion demands it.

[324] [275] The axes of chipped stone are uniform in type. They are wedge-shaped, made of diorite, and they average two kilograms in weight. The handle is a piece of creeper stem, perhaps from a Bauhinia. The pitch and cord used to fasten the stone make the tool surprisingly strong. . . . .

381 The pitch is made of mastic resin, jatai (Hymenea stigonocarpa [824] or H. stilbocarpa), and wax, as well as other unknown substances. It is placed in pots and subjected to the action of fire, then kept in pellets fastened to embira strips or in loaves wrapped in leaves. Both the arrow "poison" and the axe pitch are called by the name of duhutaarú, which means "wax."

[Fig. 62]

226 Tephrosia toxicaria is a poisonous legume, a kind of tingui
824 [Lupinus cascavella] used in fishing.
278 They are not familiar with the fishhook, and use [276: full page of figures] [277] a sort of fish trap made with bamboo or with the stem of the titara liana (Desmoncus sp.).

262 The following foodstuffs are represented in the collection.

--Guaiatú: white maize.

--Urinodzu: manioc dough, which under microscopic examination proved to be very rich in starch grains. The root, once grated, 252 is pressed [by wringing] with a straw cord, the çaaru. (1) The grater [145]

1. [Heloisa Alberto Torres notes that the cylindrical tube used to press manioc by some Amazonian tribes must have spread from the Guianas to the valley of the Amazon. Métraux considers the woven band used for the same purpose and found on the periphery of the tube territory a more primitive form. The simple straw cord of the Nambicuara would thus constitute an even more primitive variant.]

is of the type used by the Xingu Indians (Suya, etc.). It consists of a board with about two [twenty?] rows of small sticks.

[Fig. 17]

262 --The larvae of a butterfly, which they eat alive.

--Katunuzú: anthill clay, which they also eat.

. . . . . .

[824] --A mushroom, orelha de pau (Polyporus sp.), which is eaten, and beans (Phaseolus sp.) of unusual aspect were also found in one village. [278] The smoked [moqueada] head of a great anteater was [251] found in a basket by Miranda Ribeiro during the 1909 expedition.

415 Mortars (nutêzê) are hollowed out by means of fire and used to
252 pound meat and other foods.

[262

A. Arezi mushroom (Poliporus sp.) eaten by the Serra do Norte Indians.

B. Cord of monkey hair (Pithecia satanas).

C. Necklace made with minute shreds of feather stems.

D. Ornamental motif of the Serra do Norte Indians.

372 They make fire with mastic resin sticks, the tips of which are wrapped in straw to protect them from the rain.

[Fig. 63]

241 415 Their plots are worked with pointed sticks. The seeds of urucu, gourd plants (Lagenaria) and cotton are kept in leaf containers.

278 824 Medicinal fruit (Solanum mammosum) is also saved, as well as roots, leaves, etc.

[Fig. 31]

386 The collection contains two samples of dyes: a paste of urucu and fat, sweetly scented, which the women use to paint their body after the bath (huduhukaidi); and a variety of red ocher. [279]

248 Cotton (1) is represented by seeds (rim de boi variety) in leaf

[171]

1. According to the studies of Fa. Schmidt and Nordenskjöld (concerning hammocks), cotton reached Brazil from the Andes and was cultivated mostly by the Tupian Indians in the midst of the Amazon jungle. It is used less extensively among the Arawakan Indians. This distribution, due in part to the needs of the plant, explains its presence among the Nambicuara, who are located at the extreme west of the plateau. (R. L.)

[203 286] containers; cotton thread (kondzú) from a spindle (gdaretatú); skeins [855] of spun cotton; cotton fabric (sareguêzê--strap used to carry children).

[283] The spindle is made of a palm splinter imbedded in a round potsherd.

[Fig. 64]

415 924 Kateçú are fruits of the Lagenaria genus used as containers and storage vessels. Some hold crudely chopped tobacco and are stoppled with a corn cob, a method frequently used by the frontiersmen.

[See fig. ... (28) p. 30B.]

301 [280] [One necklace not mentioned earlier] is made with the
[824] seeds of a Cyperacea (tanieikerê) which the Suya of the Xingu River also use. . . . .

Oradaikruzê is a beautiful bracelet made with the tail rings of
[825 237] the giant armadillo (Dasypus gigas). It looks like ivory. Other bracelets are made from the nuts of the babassu and pindova (Orbignya speciosa)
[824] palms.

[Fig. 65]

Bands for the upper arm are made of cotton and fastened similarly to those of the Paressi.

291 The ialaçu is a simple fiber cape, widely used, which fastens to the neck and hangs down the back. There is also a black feather cape in the collection.

301 [281] The stem of the unetizú (nose plume) is made of thin bamboo or the stalk of a tough grass (Andropogon).

. . . . The helmets of puma or jaguar hide are used in that region only by the Nambicuara and by the Cayabi of the Paratininga.

[Fig. 66]

285 Max Schmidt broadly classified Brazilian Indian plaiting into Palmblattflechterei (palm-leaf plaiting) and Doppelfadengeflechte (double-strand plaiting). But he also admitted the existence of a third type, where two elements running in different directions are crossed by a third. This type occurs frequently on the Xingu River . . . and is found in Nambicuara baskets (atiçú).

[282: page of figures]

[283] As plaiting material the Nambicuara use titara liana and sometimes bamboo.

[293] . . . . Nambicuara fans, made with bacaba leaves, . . . are of pentagonal shape . . . .

534 A kind of nose flute made of gourd discs (hait-teataçú) seems
[171] to have been borrowed from the Paressi.

[Fig. 67]

The double flutes were borrowed from the Tapajoz tribes (Mundurucu, Maue, etc.). [See fig. . . . (70, p.]

/213 cont./
278 126 [1H] [162]
last Çabanè-Tagnani survivors, again showed me the complete preparation of curare. All the information gathered in the various Ñambikwara groups visited agrees with what I was able to observe.

In possession of these facts I prepared several times a certain quantity of curare identical to that of the Ñambikwara. The action of these different samples was tested in the field in order to be used in comparison with later experiments upon the return of the mission; thus any possibility of error due to a possible alteration of these products was eliminated.

A year has gone by since this time, and the various solutions brought back have kept their activity; they made it possible to examine rigorously their curarizing properties.

Preparation of Curare

278 824
Plant. Ñambikwara curare is prepared with only one plant, a Strychnos which grows in the sandy brushwood of the central plateau of the Mato Grosso. Although not rare this species is not abundant anywhere.

It is a bush two meters high (Pl. III, A), with a rather strong stem and downward-hanging branches, more or less sarmentous and sometimes changing into tendrils at the ends; I never saw a really twining example of this species. The branches have a reddish bark, /214/ without thorns, which is covered, as is the stem, with white concretions. The leaves are elongated and small or medium in size. The species is very polymorphous. No specimen bore flowers or fruit.

The Strychnos group is one of the most difficult to study. Many species rarely flower, and in the absence of flowers it is often impossible to identify them.

In certain features the species of the Ñambikwara is comparable to St. medeola. It exists in the plant collection of the Rondon Commission, but also without flowers and undetermined.

/214 cont./

278 Only the bark of the roots impregnated with a reddish,
824 gummy juice is used in the preparation of curare. The plants which grow in sandy places are considered to be richer in poison; they are recognized by the bright red color and moisture exuding from incisions made in the bark. Roots from clayey earth are dry and considered incapable of giving an active product.

The Ñambikwara of the Juruena consider it essential to gather the roots in the morning at dawn before the sun gets too hot, and they only use fresh bark. The Çabanè use dried, stored bark by preference.

Çabanè Curare

278 The preparation of Çabanè curare may be taken as typical. It comprises three main operations: draining of the bark in portions with fresh water; rapid boiling to rid the product of some of its impurities; slow concentration at low heat.

[410] Immediately after their harvest the roots are washed and then scraped with a splinter of bamboo or a piece of iron to detach the bark. Small, very fine shavings are thereby obtained which are dried and kept in baskets or gourds.

[411] Draining of the bark. The bark is placed in a small, elongated basket (kǫnǫsimatã) of bamboo lamellae reinforced by large leaves (kǫnǫkǫnǫsi) and hung by two vertical supports over an earthen dish. Over the bark they pour 200 to 250 cubic centimeters of cold water; a blood-red liquid filters off slowly. The filtering takes 15 to 20 minutes; when it is almost over fresh water is again poured over the bark. This operation is repeated six to eight times until the bark is exhausted (Pl. IV, A-3).

[412] Boiling on a brisk fire. After each operation the liquid obtained is poured into a receptacle placed directly over a strong fire; it is constantly /215/ stirred with a wooden spatula and does not take long to boil in large bubbles. When it

271 Preparation of Çabanè curare (Vilhena region)

A. The curare is skimmed during the boiling.

[Nr] B. Testing of the degree of concentration of the product with the aid of a straw.

[415 324] C. Funnel made of a leaf rolled into a horn and the leaf used to make it.

[415 323] D. A pot of grey clay, badly baked, used to prepare and keep curare (Nhambikwara of the Cabixi River).

For about seven
221 months these bands go wandering across the prairie in search of small
[222] game, small animals such as caterpillars, spiders, grasshoppers, rodents, snakes, lizards, and so forth, and fruits, grains, roots or wild honey—in short, all that might keep them from dying of hunger. Their camps, set up for one or several days, sometimes for several weeks, consist of as many temporary shelters as families, made of palms or branches stuck in a semi-circle in the sand and connected at the top. This is the period when the quest for food absorbs all activities. The women equip themselves with digging sticks, and
221 411 184 the men hunt with the bow and arrow, of which several types must be distinguished. The eastern groups have a bow with a flat section which evolves toward a convex-plane section or a concave-convex section when one moves westward. As for the arrows, those made for hunting birds have a blunted tip. Arrows for fish have three to five points, each one formed like a minute harpoon, and the stem is without barb. The poisoned arrows (1), whose tip is protected [15]

1. See below, p. 95.

by a sheath of bamboo, are reserved for hunting monkeys and small game. Those for large game have a long lanceolate point. The barb is attached or sewed on. Besides the bow and arrow, the men use a club
[189] which often takes the form of a javelin, and its use is reserved for magic and war operations (1).

1. Cf. below, p. 99.

824 The primary materials of the indigenous industry consist of varied
825 woods, wax from wild bees, resin, fibers of the buriti palm trees (Mauritia vinifera) and tucum (Astrocaryum tucuma) bone of the monkey, teeth and claws of mammals, fur (only to make ornaments), feathers, quills of porcupines, vegetable shells and river shells, stones,
412 cotton and grains. As implements they have knives made from a sharp piece of bamboo, from stones crudely fashioned, or from fragments of iron or steel obtained through exchange, and fixed with the aid of wax and cord between two pieces of wood forming the handle. Drills are made of a borer of stone or iron mounted at the end of a stick
[17] which they turn between their palms. The Rondon Commission expanded the use of axes and metal hammers, and the old stone axes serve now only as small anvil blocks for fashioning shell or bone.
[415] The use of stone polishers must also be mentioned and, among the objects of current usage, the spindles, combs, baskets and gourds to carry water.

[1] All birds are eaten except the vultures (urubú).

[p. 126]

164 The aboriginal name for this disease in the Serra do Norte is báanêcêdútú. I believe that the word refers to the curvilinear shape [825] of the lesions, for báanêndútú is the generic name given by these Indians to the spirally constructed gastropod shells.

The above will suffice to indicate that this pathological manifestation had not yet been described among Brazilian aborigines.

Some of the skin diseases peculiar to our Indians bear no similarity to the báanêdêdútú of the Serra do Norte.

The following diseases may be disregarded at once [as possibly related forms]: yaws [pian], mange [curub], pinhã, munga, pareb, xerodermae (ichthyoses), leishmanioses, etc.

[Page of plates p. 184.]

[185] Pereb is the Tupian name for commonplace skin boils such as those caused by staphylococcus.

Pinhã was found among some Amazon Indians by Martius. It is probably a kind of furuncular disease. Martius considered it a sort of anthrax.

Yaws is now well known; as far back as 1558 it was admirably described by Thévet, and in 1578 by Jean de Léry. In 1613 the learned priest Yves d'Evreux masterfully pointed out its likeness to the "Naples disease." The Indians of the Serra do Norte exhibit nothing of the sort.

It should also be noted that they do not know leprosy or the leishmaniosic sores which afflict the personnel of the Telegraph Line.

I did not see a single Indian afflicted with malignant sores [feridas bravas], while the infirmary at São Luiz de Cáceres overflowed with victims of the disease who came from the camp.

Nor does the Nambicuara disease bear any similarity to the skin disorder of the "Antisian" Indians (Mosetene, Tacana, Yuracare) who live on the eastern watersheds of the Andes in Peru and Bolivia.

The hombres overos, as the Spaniards named these Indians, exhibit large, irregular, whitish patches of unclear contours, located chiefly on the joints.

D'Orbigny states that these spots never have a grainy appearance; that children are spared; and that the skin of those affected remains completely smooth.

101 The Anunze of Campos Novos speak of the "Tayopa" and "Shaodi-Koka" who have not yet been found; in the far north of the region, Rondon has recently discovered tribes such as the Kepikiriwat(1)

1. The Tupian Indians of the Gi-Paraná and other tribes were described in Missão Rondon [The Rondon Mission] (Rio, 1916), and in the memoirs of Curt Nimuendajú published in the Journal de la Société des Américanistes. The Archivos do Museu Nacional, Vol. 25 (1925) contain "Notas Antropometricas sobre os Indios Urupás [Anthropometric Notes on the Urupa Indians]" by Roquette-Pinto and A. Childe.

which belong to other groups.

The Tagnani and Tawite refer to an enemy tribe which they call "Malutundú," "Ualutdú" or "Ualút-ndú."

[Page of plates 216.]

[217] It is likely that the Indians on whom the Nambicuara [825] have bestowed this name, which means tatu galinha [a nine-banded armadillo, Dasypus tatusia novemcinctus] are the Mundurucu of the Upper Tapajoz.

It is worth noting that the Anunze called the Cocozu "Cocozê," while the latter call the former "Anunzú."

The Cocozu call the southwestern group "Uaintaçú," while the Anunze call them "Uaindzê."

These Uaintaçu or Uaindze are the same people known in the vicinity of Mato Grosso, on the Guaporé River, by the name of "Cabishi"—a term which in turn has been applied by the Paressi in a pejorative way to the Cozarini group of their own tribe.

The Paressi have also bestowed on the Nambicuara the name of "Uaikoákôré" (Ground Brother) because they sleep directly on the ground.

[142] The Tapanyuna of old, located by the chroniclers on the Upper Tapajoz, must have been Nambicuara of the Cocozu group, who are indeed the darkest people in the whole Juruena Valley. They fit their Tupian appellation of "black men."

[Fig. 18]

241 They subsist chiefly on the produce of husbandry; the development of agriculture in their backward milieu [229] constitutes one of the paradoxical traits of this tribe.

262 As a general rule, it may be said that the Nambicuara eat of everything; unlike some other Indians, they do not shun certain species of animals. A mosquito that lands on their body, a louse, a locust, a small lizard that scampers by--nothing is spared.

[252] Some of them carry sticks to kill any snakes they may encounter; they roast them in the embers and eat the delicacy with pleasure.

After roasting their catch, they discard only the stomach.

At the camp on the Primavera River, whenever one of them was hungry he would run off into the bush and return with a live calango [a small lizard]; after beating the head of the little animal against a piece of wood [230] he would throw it into the hot ashes. Later he would tear open the animal's abdomen with his nails, remove the stomach and enjoy the rest. On another occasion, the Indians caught an armadillo and killed it by twisting its neck.

In hunting and fishing they use arrows that will be described later.

252 They prepare the eggs of the wild duck (Cairina moschata,
262 L.) by nestling them in shallow depressions in the embers after
[265] turning them on a diminutive spit stuck through a small hole punched in the shell.

The meat of large game--deer, paca (Coelogenis paca),
[225] capybara (Hydrochoerus capybara)--is utilized only after it has been pounded in a mortar or beaten between two pieces of wood.

[Fig. 19]

264 They cut off large pieces with their nails, with their teeth, and sometimes with knives of wood or bamboo. No sooner have they gulped down what is in their mouth than they suck their fingers, clucking their tongue noisily.

251 The Tagnani are familiar with the preserving properties of smoke; the meat we handed out to them was not all eaten on the same day. They hung the remnants on the barbecue [moquém].

264 The children partake of a meal immediately; the women eat later... whatever is left over, if there is a leftover. This, by the way, is the rule even among civilized Indians... But in general, if there is plenty, each helps himself to whatever there is, when he wishes and as he wishes; the food belongs to all.

262 [236] They skillfully remove the gall bladder from the liver of the animals they devour, but they do not have a special name for it.

[252] Aarú is a cake which the Cocozu prepare by pounding up a whole roasted armadillo in a mortar until its bones are completely mashed, and then mixing it with manioc dough in the form of beiju.

[825] An upland rat (Scapteromys gnambiquarae, Miranda Ribeiro), which the Paressi call cőlori, is prized by the Nambicuara as a delicacy. They call it arantacú.

241 They gather and utilize the produce of their husbandry from day to day. They have no special harvesting time, and no stores or surpluses except for the tobacco which they keep between two sticks hanging from the ceiling thatch.

251 There is always manioc dough in the house; it is the Nambicuara bread, which they eat with all their other foods. They keep the dough in large baskets lined with pacova (1) leaves.

1. A kind of banana. (Ed.)

[237] Leftover honey is kept in the gourd; it does not reach fermentation because the desire [to drink it] soon revives in some Indian...

261 [115] We did not see any rite connected with food; but the soldier Gouveia, who was held prisoner in a Nambicuara village for six months in 1911, witnessed such a ceremony. The Indians of that village (which was named Urutau) had killed a large tapir. (1) This was [825]

1. Tapirus americanus, fairly abundant along the rivers of the area. Hard to catch because very wary.

[the pretext for] a feast. They dragged the animal to the village plaze. Then the men went off into the bush to gather branches with

000
[411]
223 [245] The Tagnani also use a kind of fish trap.

A rare type of blunt arrow is designed for the capture of birds which serve as playmates to Nambicuara children.

The birds are felled by the impact and caught easily. Some
231 become used to their cruel captivity; a woodpecker (Colaptes
[825] campestris, Vieil) was occasionally imprisoned by a boy under a gourd. No sooner did the child remove the cup than the bird, instead of flying away, would perch upon him. It is true that the Indian nourishes his domesticated birds very well: he constantly feeds them from his own mouth, gently gorging them.

[Fig. 59]

To our intense surprise, as the cephalic measurements of an Anunze woman were being taken, a baby rat fell from the nape of her neck where it had apparently been living cozily, hiding in her hair as in the grass where it was born.

[825] Doves (Chamepelius talpacoti), young vultures (Sarcoramphus papa, Catharista atrastus brasiliensis, Bonap), monkeys and small owls are also domesticated in the Serra do Norte.

Before the days of the Rondon Commission, the Nambicuara were not familiar with the ox, the mule or the dog. They are still afraid of the ox because of its horns; they have a liking for the donkey, whose meat they find similar to that of the tapir.

[246] They are now good friends of the dog, which at first frightened them greatly; they steal a few whenever they can, and these dogs quickly take a fancy to [the Indians] because they are so well fed. In the master's eating gourd there is always room for the dog's muzzle.

855 They carry their children in a strap slung over the shoulder and across the chest, which the Cocozu make with straw and the others with cotton.

484 They take along everything they own on the shortest excursions; this is a nomadic habit surviving among a nearly sedentary people.

241 A population as large as that of the Serra do Norte would be unable to subsist exclusively on hunting and fishing. The Indians would be forced to travel far and wide in search of food; they would have been annihilated long ago, or else deprived of those characteristics which only their isolation could maintain.

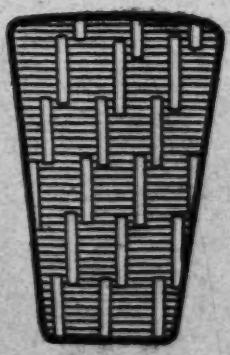
C

12417



D

A. Arezi mushroom (Poliporus sp.) eaten by the Serra do Norte Indians.

B. Cord of monkey hair (Pithecia satanas).

C. Necklace made with minute shreds of feather stems.

D. Ornamental motif of the Serra do Norte Indians.

301 [280] [One necklace not mentioned earlier] is made with the [829] seeds of a Cyperacea (tanieikerê) which the Suya of the Xingu River also use. . . . .

[825 237] Oradaikruzê is a beautiful bracelet made with the tail rings of the giant armadillo (Dasypus gigas). It looks like ivory. Other bracelets [824] are made from the nuts of the babassu and pindova (Orbignya speciosa) palms.

[Fig. 65]

Bands for the upper arm are made of cotton and fastened similarly to those of the Paressi.

291 The ialaçu is a simple fiber cape, widely used, which fastens to the neck and hangs down the back. There is also a black feather cape in the collection.

301 [281] The stem of the unetizú (nose plume) is made of thin bamboo or the stalk of a tough grass (Andropogon).

. . . . The helmets of puma or jaguar hide are used in that region only by the Nambicuara and by the Cayabi of the Paratininga.

[Fig. 66]

285 Max Schmidt broadly classified Brazilian Indian plaiting into Palmblattflechterei (palm-leaf plaiting) and Doppelfadengeflechte (double-strand plaiting). But he also admitted the existence of a third type, where two elements running in different directions are crossed by a third. This type occurs frequently on the Xingu River . . . and is found in Nambicuara baskets (atiçú).

[282: page of figures]

[283] As plaiting material the Nambicuara use titara liana and sometimes bamboo.

[293] . . . . Nambicuara fans, made with bacaba leaves, ... are of pentagonal shape . . .

534 A kind of nose flute made of gourd discs (hait-teataçú) seems [17] to have been borrowed from the Paressi.

[Fig. 67]

The double flutes were borrowed from the Tapajoz tribes (Mundurucu, Maue, etc.). [See fig. ...(70, p.]

THE COLORS

822 The differentiation of colors has been studied in eleven patterns for which we give the list of Indian terms below.

Groups a and b present common characteristics. They distinguish white, black, red, blue, and put yellow and green in a single category. (1) However, while group a extends that assimilation

[193 197 171]

1. The term which designates green and yellow affects the singular form of a reduplicative plural. This morphological aspect is found again in Ŝibŝa: Thus in Bribri, green = tspa-tspa, yellow = kŏlo-kŏlo; in Guatuso, yellow = mari-mari; in Rama, yellow = nugnugna, green blue = nrinnrinma. (Cf. Lehmann, loc. cit., I, p. 333, 394, 434, 435).

to yellow ocher, group b stops at clear yellow and classes yellow ocher with burnt sienna in the same category, designated by the term of dialect a1 for "black." (2) Group c distributes the colors in a very

•[826]

2. In accord with the anthropological judgment of the Indians who do not distinguish themselves from the "whites" as "yellow," but as the "colored" from the "clear":

(56) uăi ʔaniena taĵkedniena (b1)
You are fair (clear), I am dark.

different way: one same category unites the reds and the yellows (which furthermore suggests the scale of the tincture of urucu), while the blues are attached to green and black.

The most esteemed colors are white and black, undoubtedly because these are the colors of the ornaments made from pearly fragments of river shells and from the dark nuts of the palm tree. Then comes red, then yellow. Green and blue are not much liked. [117]

822 198

Colors	Dialect a 1	Dialect a 2	Dialect b 1/2	Dialect c
White	ahẽndesu	ahẽndesu	dẽ ẽnde	pãte
Black	ĵundne	amũdisu	uãte, dẽdne	tapũte

TRADITION

The Nambikwara have a sharp sense of tradition. We have read above (p. 50) a remark of B1 which shows him to be sadly cognizant of the decline of his race. Customs and techniques are generally considered as legacies of the "ancestors": 173 [183 329]

58. irõtiore ikõtage ũttige.
"The ancestors taught us how to coil it [the ribbon of rubber meant for making a ball]" (b1).

One single legend was found relating to the origin of the universe. [120] It is that of the Flood, the childrens' version of which we have already given. (1) Here is the text used by adults: 173 539

1. See above, p. 69.

59. narõdõe kãũhire
narukũhihire naukaũ̃aure
nahũtende kãũ̃rage naukõdo uĩ̃ere toõdige
the water had descended the water flooded everyone to die

593 182 462 The conversation becomes animated and laughter spreads. In the dark prairie the camp fires burn. Around the fire, the only protection against the cold which descends, behind the frail windbreak of palms [342] and branches hastily planted in the ground on the side where wind or [415] rain is expected; near the baskets filled with poor objects which constitute their whole earthly treasure; lying on the ground which extends around, haunted only by other bands equally hostile and fearful, the couples, embracing tightly, are truly seen as the support of one another, the comfort, the only help against the daily difficulties and the dreamy melancholy invades the Nambikwara soul from time to time. The visitor who camps in the brush with the Indians for the first time feels tenderness as well as anguish and pity before the spectacle of this humanity so completely unprotected; crushed, apparently against the soil of a hostile land by some implacable cataclysm; naked, shivering around the hesitant fires. He circulates tip-toe among the underbrush, in the dark, avoiding crushing in his walk a hand, an arm, a trunk, whose warm reflections are seen by the light of the fires. But this misery is animated by whispering and laughter. [56] The couples clasp one another as in the nostalgia of a lost union. Their caresses, at the same time tender and candid, are not interrupted by the passage of the stranger. One senses in all [57] of them an immense gentleness, a profound carelessness, a naive and charming animal satisfaction, and, emanating from all that, something like the most moving and credible expression of human tenderness.

593 831 462 562 [517] Thus it is not surprising that the attitude of the two sexes as concerns one another is characterized by intense interest. This interest is translated in certain cases by the vocabulary. In fact the Nambikwara have only one word to express "pretty" and "young," and a single word to signify "ugly" and "old" (munʒene, ʒeʒene, bi). Their esthetic judgments are thus based essentially on human considerations, and above all, sexual ones. But the interest which is manifested between the sexes is of a complex nature. Men judge women in a mass, as being a little different from themselves. Depending on the situation, they consider them with desire, admiration, or tenderness. In itself the confusion of terms pointed out above constitutes permanent homage. But it must not be forgotten that the form of economic adaptation realized by sexual division of labor a capital role attributes to the women, since family life rests to a very large degree (probably the greatest) on the collecting of the women, but it represents an [58] inferior type of activity. The ideal life is conceived on the model of agricultural production or hunting. To have plenty of manioc, and

fat pieces of meat is a constantly relished dream, even though rarely realized. On the other hand, the provisions haphazardly collected are considered—and really are—the daily misery. In Nambikwara folklore, the expression "to eat grasshoppers" (tagare uritige, bl), a typically feminine and infantile harvest, is nearly equivalent to the French "to eat the mad cow" (to rough it). At the same time the woman is considered a tender and good being, but of the second order. The language which she uses habitually separates her from the men and unites her with the children (in the same way that she collaborates with the children in expeditions of collecting and gleaning). We shall see later that this assimilation also continues into the metaphysical thinking and that, on this latter plan, discrimination between the sexes attains proportions whose psychological attitudes are only a derisive indication. It is considered well-bred for men to speak of women with a pitying good will, and, in conversations between the two sexes, to address them with a slightly mocking indulgence. Certain sayings are heard often among men speaking among themselves:

5. uĩtnoẽunatũkhne joʔotnuũutnãdnjani denẽunatukhne. (bl)
The children do not know, I know, the women do not know.

and they bring up the group of women (dosu, al), their jokes, their conversations, with a tone of tenderness and mockery. But, of course, that is only [57] a social attitude. When the man finds himself alone with his wife around the camp fire, he listens to her complaints, considers her demands attentively, asks her help in a hundred undertakings. The male line of talk disappears, and gives way to the collaboration of two partners conscious of the essential value which they have for one another.

This ambiguity of male attitude as regards women has its exact correspondence in the equally ambivalent behavior of the female group. The women think of themselves collectively, and manifest it in several ways. In the first place they do not talk like the men. Even though a sexual language does not exist in the true sense of the word, in conversation a thousand inflections, shades of pronunciation are found which are typically feminine. Women articulate badly and affect a sort of jabbering which is reminiscent of infants' pronunciation. They whisper instead of talking out loud, and emit sounds with an affected mannerism and preciosity which are at times seductive when they are not exasperating. Thus, in dialect al, they give words an ending —ũ instead of the usual—u or —tu. They also pronounce—kititu, the verbal suffix which is for men, —kedjutu or —kedjuru.

834 nights" kanaro'etẽndige (b1); inversely, nights without moon are
842 particularly approved, as well as rainy periods. In 1938 the rains
834 were late, and the first shower came in September after six months of
[833] total drought. The event, so long awaited, was immediately celebrated by B1, who did not even wait for night to have sexual relations with his youngest wife b2. However, day-time relations are rare, and the act was carried out more ostensibly than usual, behind the thin palms of a shelter. Immediately afterwards B1 supplied a spontaneous commentary on meteorological prohibitions. Sexual relations are also, at least theoretically, forbidden between husband and wife
[856] [65] from the birth of the child to the time when he can walk. This event is hurried along by rubbing his legs with the juice of a non-identified plant (togri?iri, c) "so that he will walk quickly, so that another can be made" (1); but, by "another," is understood, un-

[71] 1. The same custom existed among the ancient Tupi. Cf. Cardim, Tratado da terra et da gente do Brasil, new ed., Rio-de-Janeiro, 1925, p. 170.

doubtedly sexual intercourse rather than their result, rarely welcome:
[847] the Nambikwara women often have recourse to abortion, and they are familiar with a great number of plants and roots for that use. We were not able to obtain a specimen.

831 The attitude of the Nambikwara toward things pertaining to
832 love can be summed up in their formula tamindige mõndage, translated literally, if not elegantly: "To make love is good." We have already mentioned the erotic atmosphere which fills daily life. Love affairs hold the interest and curiosity of the Indians to the highest degree. They are eager for conversation on these subjects, and the remarks exchanged in the camp are filled with allusions and hidden
[833] meanings. However, sexual relations are rare, and the prohibitions which limit them explain this state of affairs only partially. The thing truly responsible seems rather to be indigenous temperament.
[847] In the course of the amorous games to which couples give themselves over so willingly and so publicly, and which are often very far advanced, we have never been able to note the beginning of an erection. The pleasure looked for seems to be less of the physical order
833 than playful and sentimental. Sexual relations usually take place at night, and often not far from the fires of the camp. More often the couple draws back about a hundred meters into the neighboring bush. This departure is noted immediately, and gives rise to the most

585 The union of the husband and wife is pronounced by the chief who places in the mouth of each a large piece of fish. (1)

831

1. It has already been suggested (Kunike, "Der Fisch als Fruchtbarkeitssymbol bei den Waldindianern Südamerikas, Anthropos, VII 1912, p. 206-229) that the fish could be a sexual symbol among the South American Indians. Tastevin has vigorously criticised this hypothesis (Le poisson symbole de Fécondité ou de Fertilité chez les Indiens de l'Amérique du Sud, Id., IX 1914, p. 405-417). However, the Nambikwara ritual of marriage seems to confirm the first theory. Moreover, fish is directly treated as the symbol of sexual relations in the legend where Maire-Pochy makes a girl pregnant by [110] making her eat the fish which he himself had fished. As the origin of this Tupi story is certainly Andean (Kunike, loc.cit.; Métraux, p. 12-13; Ehrenreich, Ueber die Verbreitung und Wanderung der Mythen bei den Naturvölkern Südamerikas, Congrès International des Américanistes, Stuttgart, 1904, p. 663) we have there a supplementary piece of information concerning the affinity of the Nambikwara with the cultures of the North and West.

881 [110] There is no puberty ceremony for the boys. This is replaced by a ritual of initiation which takes place toward the ninth or tenth year, apparently. It is composed of two essential operations, [55] the giving of a name, and the piercing of the lip and of the nasal 305 septum to place some wood ornaments there. The first operation is done directly by the chief, the second by a companion whom he designates to this effect:

50. getnoãdige iochãdige ullikade uelikãdelhinere nukerere indeig
iurdenie nikama iurojãtige (b1)
When the boy is grown the chief, the chief gives him a name. A companion pierces his lip to put in the ornament. He [the chief] orders the hole [for the ornament] to be made.

• • • • •

595
601 sense of this term remains doubtful. And it has never been possible, in the course of the questions on kinship, to obtain from polygamous husbands discriminating terms for each of their wives.

595 established between the first wife and the new arrivals. The first
462 wife takes care of her children and devotes herself to the cares of
[252 the household, shredding the manioc and cooking the cumaru nuts.
262] She is occupied with feminine craft tasks. In short, she carries on her activities within the [61] limits of the sexual division of labor. The other wives aid her occasionally, but their main duty seems to be to assist their husband in his masculine tasks. They are comrades and collaborators who, in the general plan of the division of labor, could be more justifiably classed with the men. Their aid seems like a method on the part of the chief of the group to fulfill his heavy duties more easily, and like a psychological compensation for his responsibilities. When he leaves on a hunting or reconnoitering expedition, one of his polygamous wives accompanies him to hold his arrows and to carry in her basket the eventual prize. When he works around the camp or in the village, it is with their aid and com-
[515] pany. Although men and women do not bathe at the same time, one sometimes sees the husband and his polygamous wives take a bath together, the pretext for great struggles in the water, and innumerable
● [832 jokes. In the evening he plays with them, either amorously, rolling
524] in the sand embracing two, three or four, or in a childlike way. For example A1, a3 and a4, stretched out on their backs, by way of making a star with three points on the ground, raise their feet in the air and knock them against one another, bottom of foot against bottom of foot, in a regular rythm (this game is described by the term eridna(kitim, al).

595 The polygamous union is thus presented as a super-imposition
182 of a plural form of amorous companionship on the monogamous marriage, and at the same time, we insist, as an attribute of command with a functional value from the psychological point of view as well as from the economic. The women usually live on very good terms, and although the first wife has a role that might seem a little unappreciated, working while she hears at her side the bursts of laughter of her husband and of his little mistresses, and sometimes even witnesses more tender frolicking, she does not show either bitterness or jealousy. In fact, this distribution of roles is not either unchangeable or rigorous, and, upon occasion, although rarely, the

619 which cause sickness, they have given the magical herbs whose smoke blinds the dangerous *anánsu*, and the techniques which will drive away the storms. Thus the shaman operating on a symbolic level continues the struggle for survival which has been defined for the Nambicuara by the nature of their adjustment to their physical environment and their relationships to one another.

THE LIFE CYCLE

BIRTH

833 The Nambicuara recognize sexual intercourse
[842] (*winxendítsu*) as the cause of pregnancy (*kalá-jitsu*). This act takes place in the woods while the husband and wife are out hunting or collecting, for it is considered improper to have sexual intercourse in public, even at night around the common camp fire. If a shaman should see a couple in
756 sexual embrace while practicing his rites it would
833 spoil his power. Although shamans use a special hut when calling their *anánsu* there is always a chance that they may see a couple in the sexual act, so every effort must be made to avoid this
[834] danger. Shamans themselves abstain from sexual intercourse for 2 or 3 days before getting in contact with the spirits.

843 There appear to be no food taboos surrounding pregnancy among the Wakítisu. The husband continues hunting and collecting as usual, but he must avoid working too hard in the field for
[847] fear of causing his wife to abort. Women do not practice abortion, and the Nambicuara did not mention any medicines used for this purpose.
[832] Honey is considered conducive to sexual vigor and is used by young couples. Childless marriages
[843 586] are attributed to sterility in women, and a man may abandon his wife for this reason.

844 Birth takes place in the house, or in the camp if the family is out hunting. Just before expecting the birth of a child the expectant mother drinks
[824] the juice of certain herbs which are believed to facilitate birth. The husband and two older women assist in the delivery. The woman kneels on the ground and is supported by her husband. The umbilical cord is tied with a certain vine and then cut with a bamboo sliver. Among the Kitánhu it is bitten off by one of the midwives. The placenta is buried at the place of birth and when the umbilical cord dries and falls off, it, too,

562 treated with great affection. The men are jealous of their wives, and
[837] the women take pride in being faithful. In this respect they are quite unlike their neighbors, the Paressi women...

832 The couples are always petting each other, and no caress seems
302 sweeter and more tender to the lover than the woman's fingers running through his hair. This is easy to understand, for the Nambicuara head swarms with vermin...

[Fig. 38]

585 According to reports of the soldier Gouveia, marriage is a simple ceremony. The man asks the father of his beloved for consent to the union. If the father agrees, he gives the bridegroom a bow and a sheaf of arrows, telling him that with these weapons he must support the family he is about to form. That is all.

851
201 To show that a boy is the son of a certain man, they use in their innocence an expressive gesture: they join the thumb and index finger of the left hand, in the shape of a ring, around the right extended index finger. Then they tap the child and father on the shoulder, saying "Uéttl!" (son).

888 They show great respect for old people and spare them all possible effort. When we returned from the village on the Urutau to the post on the Juina, they had us carry [258] on the bow of our saddles the baskets of two old men from the group that accompanied us in search of gifts. The young men and the women all carried their own aticú and did not ask for help.

771 As to their religion, we know only that it is fetishistic. We know nothing of its cult or system, and even less of its dogma. [Fig. 33]

821 The northern groups seem to be tending toward astrolatry. Once
[771] when I had threatened the moon and the stars with an arrow, poised ready on a strung bow, several Tagnani rose abruptly and halted my gesture, speaking very excitedly, scolding me, and taking the weapon away from me as if it were a sacrilege.

The Cocozu and Anunze threaten the storm with their weapons, waving their arms in all directions and cursing the rain in loud yells.

Sometimes, instead, the women climb on a termite nest where they let out puffs of smoke and throw ashes into the air to frighten the storm.

764 We do not know anything as yet about their funeral rites. It has been ascertained, however, that they do not cremate their dead and do not eat them. They bury them directly [259] in the ground--
the Cocozu in circular pits, the Tagnani in elongated graves.

841 147 171 among South-American Indians. Since the sixteenth century, travelers have often been amazed by the insignificance of the menses of Indian women. Thus: "In the period of about one year which we spent in that country, ordinarily associating with the people, we have never seen the women have their menses" (J. de Léry, Voyage faict en la Terre du Brésil, Gaffarel, Paris, 1880, Vol. II, Ch. 17, p. 92); and more recently: "no one notes when they go through certain difficult periods peculiar to their sex" (Tocantins, "Estudos sobre os Mundurucus," Revista do Instituto Historico e Geographico Brasileiro, Vol. 40, 1877, p. 113). On the other hand, the text just cited could be interpreted in two different ways: the vocal inflexion of the informant suggested that the expression edẽdé edẽdé edẽdé signified "(this) moon (yes), (this) moon (no), (and this) moon (again)", meaning "every other moon" and not—as it is also grammatically possible—"moon, moon, moon," that is "every moon." The first sense would constitute a sort of physiological scandal, but remains, nevertheless the most probable. In fact, it is possible that the periodic indispositions are less important and more irregular among South-American women than is the case among the whites.

842 [209] The Nambikwara have a very clear idea of the relationship between sexual intercourse and conception. It is frequent that an Indian clarifies that paternity relationship is one of the blood, and not classificatory, by forming a ring with the thumb and index finger of the left hand, into which he introduces the index finger of the right hand which he glides back and forth. After this demonstration, he indicates the child saying: tayette, tayette, "my child, my child" (3).

3. From the same observation made by Roquette Pinto (loc. cit. p. 255) more than twenty years earlier, one can conclude that this gesture does not constitute an individual innovation, but a stylized social conduct.

842 833 197 Etymology points out the connection between the two phenomena: in the eastern dialect, "copulate" is translated nitnedjutu and, in the central and southern dialects, tamindige, tuyitare. These three terms are attached to the respective forms [64] for "father": ahuinosu (nosu = man, al), tamindé, uaire. On the other hand, in the northern

842 dialect, it is: "to copulate," iruja, juũreli, while "father" is uãinko;
833 but one refers rather to sexual relations by the term ʃikiʃikiʃi, whose
197 evocative value is reinforced by an appropriate gesticulation. This term corresponds, in the other dialects, to the compounds uinikuʃiʃu (a1), iekejakãtige (b1), "to copulate with rhythmic movements." Likewise, in the western dialect, "to copulate" is expressed by ãinʃore, even though the demonstration evoked at the beginning of this paragraph uses the term ninfʒore.

842 We have not been able to elucidate clearly the indigenous theory of conception (conceive: uetnẽdige, b1; from uẽtte, "child"). It implies apparently that the sperm coagulates in the uterus and progressively forms the child. The man alone would play a positive role while the woman would be reduced to that of a simple receptacle. Nevertheless, the woman is held responsible for sterility, whether it be attributed to a particular condition or to age.

834 It is difficult to say if the numerous prohibitions attached to
842 sexual relations have as a conscious end to assure conditions favorable to reproduction, or if they depend on more remote beliefs. The first hypothesis is hardly credible, for the Nambikwara are not very eager to have children. The quest for food is too hard, too difficult, to permit the care of several children at the same time, especially when they are still incapable of taking care of themselves; and especially, during the nomadic period a woman cannot carry more than one nursing child, besides the heavy basket. Thus the first steps of the child are impatiently awaited. At any rate, several prohibitions have, as a definite goal, the limitation of sexual activity. Besides the prohibition of incest (1), it is not good to copulate "moonlit

835 1. The prohibition concerning incest is formulated as follows:

(7) tuãde takenãde tamĩndige manhatte (b1)
for a sister and brother to copulate is bad

[834] but it does not seem that the infractions are punished other than by collective disapproval. A very equivocal attitude concerning a couple (A71 and a72) and the use, in their regard, of kinship terms communicated with repugnance, and manifestly contradictory to the system, makes one believe that it could be a case of parallel cousins. We have not been able to find a sure case of incest between blood relatives.

834 nights" kanaro?etẽndige (b1); inversely, nights without moon are
842 particularly approved, as well as rainy periods. In 1938 the rains
834 were late, and the first shower came in September after six months of
[833] total drought. The event, so long awaited, was immediately celebrated by B1, who did not even wait for night to have sexual relations with his youngest wife b2. However, day-time relations are rare, and the act was carried out more ostensibly than usual, behind the thin palms of a shelter. Immediately afterwards B1 supplied a spontaneous commentary on meteorological prohibitions. Sexual relations are also, at least theoretically, forbidden between husband and wife
[856] [65] from the birth of the child to the time when he can walk. This event is hurried along by rubbing his legs with the juice of a non-identified plant (touri?iri, c) "so that he will walk quickly, so that another can be made" (1); but, by "another," is understood, un-

[71] 1. The same custom existed among the ancient Tupi. Cf. Cardim, Tratado da terra et da gente do Brasil, new ed., Rio-de-Janeiro, 1925, p. 170.

doubtedly sexual intercourse rather than their result, rarely welcome:
[847] the Nambikwara women often have recourse to abortion, and they are familiar with a great number of plants and roots for that use. We were not able to obtain a specimen.

831 The attitude of the Nambikwara toward things pertaining to
832 love can be summed up in their formula tamɨndige mondage, translated literally, if not elegantly: "To make love is good." We have already mentioned the erotic atmosphere which fills daily life. Love affairs hold the interest and curiosity of the Indians to the highest degree. They are eager for conversation on these subjects, and the remarks exchanged in the camp are filled with allusions and hidden
[833] meanings. However, sexual relations are rare, and the prohibitions which limit them explain this state of affairs only partially. The thing truly responsible seems rather to be indigenous temperament.
[147] In the course of the amorous games to which couples give themselves over so willingly and so publicly, and which are often very far advanced, we have never been able to note the beginning of an erection. The pleasure looked for seems to be less of the physical order
833 than playful and sentimental. Sexual relations usually take place at night, and often not far from the fires of the camp. More often the couple draws back about a hundred meters into the neighboring bush. This departure is noted immediately, and gives rise to the most

833 lively jubilation. Comments are exchanged, jokes made, and even the young children share in the excitement whose motive they are well acquainted with. Sometimes even a small group of men, young women and children, take off in pursuit of the couple and watch the details of the operation through the branches, whispering among themselves and muffling their laughter. The principal actors do not appreciate these goings on at all. However, it is better to take part in them as well as to suffer the taunts and mockeries which greet their return to camp. It also happens that a second couple follows the example of the first and seeks, in their turn, the solitude of the bush. The Indians know and use two positions for coitus. We were not able to find out if they are practiced indiscriminately or if the choice depends on a rule. Whatever the case, besides the posterior position (toĩtelosu, a1; inkɔlékenore, b1--to copulate from the rear) so frequent in South America, another position (yataʔãdige, b1) can be described as follows: the woman on her back, the man facing her, the right leg only between the legs of the woman and the left leg outside, so that the two superimposed bodies give the general form of an X.

[66] PARENTS AND CHILDREN

593 163 847 The Nambikwara have few children. Couples without children are not rare, one or two children seem to be a normal number, and it is exceptional to find more than three in a household. Sexual prohibitions and the economic conditions on which they are based which also give rise to abortions, explain this situation. Apparently also Nambikwara formerly had the custom of beating to death the children whose mothers died during childbirth. According to the informants, this practice has been abandoned today.

853 855 The mother gives the breast lying on her side with the child pressed against her. These feedings have no fixed time. The child nurses when he wishes and as much as he wishes. Weaning takes place towards the end of the first year, but up to the age of two or three the infant returns from time to time to the maternal breast.

[514] When a child eliminates at the camp site or inside the hut, the father or mother carefully buries the excrement by digging a small hole which is quickly filled with dry sand. A great deal of care is taken to prevent the children from soiling the camp site and the objects placed near them.

619 which cause sickness, they have given the magical herbs whose smoke blinds the dangerous *enêwo*, and the techniques which will drive away the storms. Thus the shaman operating on a symbolic level continues the struggle for survival which has been defined for the Nambicuara by the nature of their adjustment to their physical environment and their relationships to one another.

THE LIFE CYCLE

BIRTH

833 [842] The Nambicuara recognise sexual intercourse (*wiesâenditsu*) as the cause of pregnancy (*halâjitsu*). This act takes place in the woods while the husband and wife are out hunting or collecting, for it is considered improper to have sexual intercourse in public, even at night around the common camp fire. If a shaman should see a couple in 756 sexual embrace while practicing his rites it would 833 spoil his power. Although shamans use a special hut when calling their *enêwo* there is always a chance that they may see a couple in the sexual act, so every effort must be made to avoid this [834] danger. Shamans themselves abstain from sexual intercourse for 2 or 3 days before getting in contact with the spirits.

843 There appear to be no food taboos surrounding pregnancy among the Wakîtisu. The husband continues hunting and collecting as usual, but he must avoid working too hard in the field for [847] fear of causing his wife to abort. Women do not practice abortion, and the Nambicuara did not mention any medicines used for this purpose. [832] Honey is considered conducive to sexual vigor and is used by young couples. Childless marriages [843 586] are attributed to sterility in women, and a man may abandon his wife for this reason.

844 Birth takes place in the house, or in the camp if the family is out hunting. Just before expecting [824] the birth of a child the expectant mother drinks the juice of certain herbs which are believed to facilitate birth. The husband and two older women assist in the delivery. The woman kneels on the ground and is supported by her husband. The umbilical cord is tied with a certain vine and then cut with a bamboo sliver. Among the Kîtîarlu it is bitten off by one of the midwives. The placenta is buried at the place of birth and when the umbilical cord dries and falls off, it, too,

[P. 102 (B)]

842 dialect, it is: "to copulate," iruja, jutireli, while "father" is yainko;
833 but one refers rather to sexual relations by the term ʃikiʃikiʃi, whose
197 evocative value is reinforced by an appropriate gesticulation. This term corresponds, in the other dialects, to the compounds yinikuʃiʃu (a1), iekejakatige (b1), "to copulate with rhythmic movements." Likewise, in the western dialect, "to copulate" is expressed by ainʃore, even though the demonstration evoked at the beginning of this paragraph uses the term ninʃore.

842 We have not been able to elucidate clearly the indigenous theory of conception (conceive: yetnedige, b1; from yette, "child"). It implies apparently that the sperm coagulates in the uterus and progressively forms the child. The man alone would play a positive role while the woman would be reduced to that of a simple receptacle. Nevertheless, the woman is held responsible for sterility, whether it be attributed to a particular condition or to age.

834 It is difficult to say if the numerous prohibitions attached to
842 sexual relations have as a conscious end to assure conditions favorable to reproduction, or if they depend on more remote beliefs. The first hypothesis is hardly credible, for the Nambikwara are not very eager to have children. The quest for food is too hard, too difficult, to permit the care of several children at the same time, especially when they are still incapable of taking care of themselves; and especially, during the nomadic period a woman cannot carry more than one nursing child, besides the heavy basket. Thus the first steps of the child are impatiently awaited. At any rate, several prohibitions have, as a definite goal, the limitation of sexual activity. Besides the prohibition of incest (1), it is not good to copulate "moonlit

835 1. The prohibition concerning incest is formulated as follows:

nights" kanaro etẽndige (b1); inversely, nights without moon are particularly approved, as well as rainy periods. In 1938 the rains were late, and the first shower came in September after six months of total drought. The event, so long awaited, was immediately celebrated by B1, who did not even wait for night to have sexual relations with his youngest wife b2. However, day-time relations are rare, and the act was carried out more ostensibly than usual, behind the thin palms of a shelter. Immediately afterwards B1 supplied a spontaneous commentary on meteorological prohibitions. Sexual relations are also, at least theoretically, forbidden between husband and wife [65] from the birth of the child to the time when he can walk. This event is hurried along by rubbing his legs with the juice of a non-identified plant (tourirri, c) "so that he will walk quickly, so that another can be made" (1); but, by "another," is understood, undoubtedly sexual intercourse rather than their result, rarely welcome: the Nambikwara women often have recourse to abortion, and they are familiar with a great number of plants and roots for that use. We were not able to obtain a specimen.

1. The same custom existed among the ancient Tupi. Cf. Cardim, Tratado da terra et da gente do Brasil, new ed., Rio-de-Janeiro, 1925, p. 170.

The attitude of the Nambikwara toward things pertaining to love can be summed up in their formula tamindige mondage, translated literally, if not elegantly: "To make love is good." We have already mentioned the erotic atmosphere which fills daily life. Love affairs hold the interest and curiosity of the Indians to the highest degree. They are eager for conversation on these subjects, and the remarks exchanged in the camp are filled with allusions and hidden meanings. However, sexual relations are rare, and the prohibitions which limit them explain this state of affairs only partially. The thing truly responsible seems rather to be indigenous temperament. In the course of the amorous games to which couples give themselves over so willingly and so publicly, and which are often very far advanced, we have never been able to note the beginning of an erection. The pleasure looked for seems to be less of the physical order than playful and sentimental. Sexual relations usually take place at night, and often not far from the fires of the camp. More often the couple draws back about a hundred meters into the neighboring bush. This departure is noted immediately, and gives rise to the most

756 by singing calls his *ondoro*, who eventually comes
754 up out of the ground in front of him. The *ondoro* may be in the form of a bird or a jaguar, but is very small in size. The shaman wears a hat made from a jaguar skin and a necklace made from jaguar claws and teeth. The shaman offers the hat and the necklace to his *ondoro* if he will do his bidding. If the *ondoro* is satisfied with the singing and the decorations he will carry out the sha-
755 man's orders. The procedure followed in curing an individual who has been made ill by sorcery is much the same. The shaman calls his *ondoro* by singing and asks that he help him draw out the object. The *ondoro* enters the shaman, who then sucks out the dangerous object. In mild cases the shaman draws out bamboo slivers, but in cases of severe illness he draws out the bones of fish or the entrails of birds.

775 The ghosts of the dead (*opidnadire*) who live around the stone mountain from which the Nambicuara came, periodically come to the villages and camps asking for food. They are not dangerous if they are well-treated. When the shaman says that the *opidnadire* are around, the people prepare manioc cakes, roast ears of maize, and broil meat. They then gather around the shaman and sing together with the ghosts. The shaman thanks the ghosts for their singing and they finally go away. If the ghosts are dissatisfied with
[753] the offerings and the singing they become angry
[755] and make the children ill. To cure the children, a more elaborate feast has to be prepared for the ghosts.

775 In every case, contact with the ghosts of the
533 dead or with the spirits of dead shamans is made through singing. The Wakitieu do not use tobacco, drums, or rattles to communicate with the supernatural. One becomes a shaman when he learns the song of an *ondoro*, which he later uses whenever he wishes to contact his spirit helper. Everyone in the band appears to know the songs which bring the *opidnadire*. Shamans practice
● [534 continence before important rites, for if the
754] *ondoro* observe sexual intercourse they become angry and take away all the cotton from the bushes.

757 In addition to treating illness through shamanistic practices, the Nambicuara resort to more practical methods. They know herbs, the juice of which is later poured over the head or stomach of a

619 which cause sickness, they have given the magical herbs whose smoke blinds the dangerous enemy, and the techniques which will drive away the storms. Thus the shaman operating on a symbolic level continues the struggle for survival which has been defined for the Nambicuara by the nature of their adjustment to their physical environment and their relationships to one another.

THE LIFE CYCLE

BIRTH

833 The Nambicuara recognize sexual intercourse (wintedulive) as the cause of pregnancy (halelive). This act takes place in the woods while the husband and wife are out hunting or collecting, for it is considered improper to have sexual intercourse in public, even at night around the common camp fire. If a shaman should see a couple in 756 sexual embrace while practicing his rites it would 833 spoil his power. Although shamans use a special hut when calling their enemies there is always a chance that they may see a couple in the sexual act, so every effort must be made to avoid this danger. Shamans themselves abstain from sexual intercourse for 2 or 3 days before getting in contact with the spirits.

843 There appear to be no food taboos surrounding pregnancy among the Wakitásu. The husband continues hunting and collecting as usual, but he must avoid working too hard in the field for fear of causing his wife to abort. Women do not practice abortion, and the Nambicuara did not mention any medicines used for this purpose. Honey is considered conducive to sexual vigor and is used by young couples. Childless marriages are attributed to sterility in women, and a man may abandon his wife for this reason.

844 Birth takes place in the house, or in the camp if the family is out hunting. Just before expecting the birth of a child the expectant mother drinks the juice of certain herbs which are believed to facilitate birth. The husband and two older women assist in the delivery. The woman kneels on the ground and is supported by her husband. The umbilical cord is tied with a certain vine and then cut with a bamboo sliver. Among the Kitásulu it is bitten off by one of the midwives. The placenta is buried at the place of birth and when the umbilical cord dries and falls off, it, too,

842 dialect, it is: "to copulate," iruja, juêreli, while "father" is uzinko;
833 but one refers rather to sexual relations by the term ŝikiŝikiŝi, whose
197 evocative value is reinforced by an appropriate gesticulation. This term corresponds, in the other dialects, to the compounds ŝinikuŝiŝu (a1), iekejakiŝige (b1), "to copulate with rhythmic movements." Likewise, in the western dialect, "to copulate" is expressed by ainjore, even though the demonstration evoked at the beginning of this paragraph uses the term ninjore.

842 We have not been able to elucidate clearly the indigenous theory of conception (conceive: yetnêdige, b1; from yette, "child"). It implies apparently that the sperm coagulates in the uterus and progressively forms the child. The man alone would play a positive role while the woman would be reduced to that of a simple receptacle. Nevertheless, the woman is held responsible for sterility, whether it be attributed to a particular condition or to age.

834 It is difficult to say if the numerous prohibitions attached to
842 sexual relations have as a conscious end to assure conditions favorable to reproduction, or if they depend on more remote beliefs. The first hypothesis is hardly credible, for the Nambikwara are not very eager to have children. The quest for food is too hard, too difficult, to permit the care of several children at the same time, especially when they are still incapable of taking care of themselves; and especially, during the nomadic period a woman cannot carry more than one nursing child, besides the heavy basket. Thus the first steps of the child are impatiently awaited. At any rate, several prohibitions have, as a definite goal, the limitation of sexual activity. Besides the prohibition of incest (1), it is not good to copulate "moonlit

●835 1. The prohibition concerning incest is formulated as follows:

(?) tyaîde takenaîde tamîndige manhatte (b1)
for a sister and brother to copulate is bad

[844] but it does not seem that the infractions are punished other than by collective disapproval. A very equivocal attitude concerning a couple (A71 and a72) and the use, in their regard, of kinship terms communicated with repugnance, and manifestly contradictory to the system, makes one believe that it could be a case of parallel cousins. We have not been able to find a sure case of incest between blood relatives.

[58] Dihemodiednige (bl), say the Nambikwara men: "it is a good
582 thing to marry!" But it is not easy. The ideal marriage is the one which gives a "young and pretty woman" (monodjinigere, bl) whose virginity one will have (to break the hymen: tajordtige, bl). But such women are precisely the ones who are claimed by the chiefs or shamans, and only a few young men will have a chance to obtain such wives. The others are condemned to a long period of celibacy
[838] which they will break by having sexual relations with their brothers-in-law, or else they will marry an "old woman" who cannot have sexual relations (tinoanebidere, bl), one who is widowed or repudiated, whom no one wants. Such marriages are not rare among the Nambikwara, and are explained by the fundamental economic role of the couple which we have already commented on. But they are not permanent. When the young man feels his position in the group
582 strengthened, or when a better occasion is presented he abandons
584 (amnjdtige, bl) his old wife to take another (ulamtunjdtige, bl) who
587 is younger and more seductive. It happens that a man thus marries three or four wives successively before considering himself satisfied.(1)

[71] 1. Here also, the documents of the 18th century relating to the Tupi support the comparison: "..... at times they take some old woman from whom they do not expect children, because there are no others, only so that they will cook the food, since they have no mother or sisters-in-law to take care of them, thus they are cared for, and are contented at present time with some old woman by whom they are always well treated and then taking other women by whom they have children later, either leaving the first wife or keeping her, if she wishes, for the reason mentioned above." (Anchieta, loc.cit., p. 260-261).

The repudiated woman [111] goes to live with her parents if they are still living, joins up with another man if she has the opportunity or even remains her former husband's fire, whose existence she shares and whose tasks she participates in, but in a slightly inferior position. Such is the position of b3 in the household of her ex-husband B1. Another method of obtaining the young woman desired consists of
● §56 seducing her, even if she is married. Adultery and more generally sentimental intrigues are very frequent among the Nambikwara.

836 who seem to be susceptible to violent passions. We knew an Indian who fled with a Paresi Indian girl during our stay, and lived with her for several months hidden in the bush and fleeing the husband who was in hot pursuit after them. Here is the way an informant (B15) tells of a former adventure. He reconstructs a dialogue with the beloved woman:

51. ajodarinjẽ — otendnjẽ — ajdotẽha ẽjdakanjajni ẽtnadajẽ ajhajtasi'ndige tamimednjẽ (b1)
Do you want to make love?--I do not wish to. --You are worth nothing! I want to make love or I will kill you! Let us go make love.

Very anxiously the woman responds:

higekanhẽ ẽairirẽ ẽalrideduẽ etẽdahẽ dung-rajeni (b1)
Do it quickly, my husband will be angry, he will beat me.

684 686 There is no social sanction against adultery; but the wronged husband can avenge himself in a fearful manner and in circumstances of this type poison, used either against the wife or against the lover, plays its role. In order to avoid such incidents, the companions intervene between the adversaries and counsel the seducer to disappear for a while:

52. ijebetnjẽ ajẽnakatedajẽni ekudde ekudde ekudde ekudde ekudde ekudde ekudde ekudde kajẽdodni ujẽnarenjani (b1)
Go away. --I am going far away. --When this moon is ended and that one, and that one, and that one, and that one, and that one, and that one, then, in that one, you may return.

We knew an Indian (C11) whose wife disappeared one day, having left with a member of his group. He thought first of revenge, but his companions intervened, and it was finally decided that the lover should keep the wife and would give him a dog as compensation. Several months later, the lover died (we were not able to find out whether the death was normal or accidental), and the woman returned to her husband, who said he was very happy to have acquired the dog also. This story should not be interpreted in the sense of an equivalence, conceived by the Indian spirit, between a woman and a dog. We have insisted too much on the fundamental role of the woman in Nambikwara life to have to return to that here. But in groups where trade [112] exists in such a primitive form (1) exchanges of goods have as a

1. Cf. p. 93 f.

627 The chief Adrose-
[622] lates quarrelsome individuals but appears to have no powers of coercion. The Wakitins claim that individuals quarrel but they do not fight among themselves nor do they remember any cases of murder. Unwanted individuals are exiled by common agreement. Houses, fields, and some implements are common property, and food is shared among the members of the band. Axes, machetes, and knives, although owned by individuals are freely used by other members. At death, privately owned tools pass to a man's sons or to his brother. The bow is customarily broken and left on the grave. Even these rules are not strictly adhered to, for when a man becomes seriously ill other men begin to help themselves to his property and the one with the "strongest mouth" gets the most. If the man recovers he cannot reclaim his things but must set about accumulating a new supply.

543 The wife and the children are under the strict control of the husband. Although boys must obey their fathers they owe no special obedience to their mothers. Boys sometimes throw stones and sticks at their mothers and the old women; the older men not only laugh but even encourage this disobedience. The bond between brothers is very close. On occasion they share each other's wives. No particular respect is paid to in-laws.

RELIGIOUS BELIEFS AND PRACTICES

774 According to the Wakitins the spirits are the source of all danger, misfortune, sickness, and death. The ghosts of the dead (*opinkadiw*), bring sickness unless offerings of food are made to them. The ghosts of dead shamans (*wakaru*), belonging to other bands bring thunderstorms which destroy gardens and make hunting difficult. In addition to the ghosts, there is *tsopté*, the hawk of death who lives in the sky, and *wiwé*, the evil armadillo who lives under the ground and wants to destroy the villages and camps of the Nambicuara.

Tsopté is an enormous hawk with huge wings, tail, and claws, who sits in a tree made of human bones. This tree (*kitsikatsu*) is situated on the shore of a shallow lake in the sky. Shooting stars are caused by *tsopté* defecating at night. A small red bird (*kindewan*), who lives with *tsopté*, urinates into the lake and when it fills up the urine overflows and comes down in the form of rain.

542 treated with great affection. The men are jealous of their wives, and
● [137] the women take pride in being faithful. In this respect they are quite
unlike their neighbors, the Paresní women...

832 The couples are always petting each other, and no caress seems
302 sweeter and more tender to the lover than the woman's fingers running
through his hair. This is easy to understand, for the Nambicuara head
swarms with vermin...

[Fig. 38]

585 According to reports of the soldier Gouveia, marriage is a
simple ceremony. The man asks the father of his beloved for consent
to the union. If the father agrees, he gives the bridegroom a bow and
a sheaf of arrows, telling him that with these weapons he must support
the family he is about to form. That is all.

851 To show that a boy is the son of a certain man, they use in
201 their innocence an expressive gesture: they join the thumb and index
finger of the left hand, in the shape of a ring, around the right extended
index finger. Then they tap the child and father on the shoulder, say-
ing "Uérti!" (son).

891 They show great respect for old people and spare them all possi-
ble effort. When we returned from the village on the Urunas to the
post on the Juína, they had us carry [258] on the bow of our saddles the
baskets of two old men from the group that accompanied us in search
of gifts. The young men and the women all carried their own stuff
and did not ask for help.

771 As to their religion, we know only that it is fetishistic. We
know nothing of its cult or system, and even less of its dogma. [Fig. 33]

821 The northern groups seem to be tending toward astrolatry. Once
[771] when I had threatened the moon and the stars with an arrow, poised
ready on a strung bow, several Tagnani rose abruptly and halted my
gesture, speaking very excitedly, scolding me, and taking the weapon
away from me as if it were a sacrilege.

The Cocozu and Anunse threaten the storm with their weapons,
waving their arms in all directions and cursing the rain in loud yells.

Sometimes, instead, the women climb on a termite nest where
they let out puffs of smoke and throw ashes into the air to frighten the
storm.

764 We do not know anything as yet about their funeral rites. It
has been ascertained, however, that they do not consume their dead
and do not eat them. They bury them directly [258] in the ground--
the Cocozu in circular pits, the Tagnani in elongated graves.

838 [595 582 605] Because of the fact of partial polygamy which reigns within the group, and which is manifested in the fact that the youngest and prettiest women are periodically withdrawn by the chief or the shaman from the regular cycle of marriage, the young men often find themselves in difficulty as regards marriage, at least during part of their adolescence, no potential wife being available. This problem is resolved by homosexual relationships, which the Nambikwara language (bl) has named poetically: tamindige kihãdige, that is false love. These relationships are frequent among young people and are carried on much more publicly than normal relations. The couples do not retire to the bush as the adults usually do. They install themselves near a fire of the camp under the amused eyes of the neighbors. The incident gives rise to some joking comments, usually not carried very far. These relations are considered infantile, and hardly any attention is paid them. The question remains unanswered for us as to whether these practices are carried on to complete satisfaction, or are limited to sentimental effusions, accompanied by erotic play such as those which characterizes, for the most part, relations between husband and wife. Whatever the case may be, the essential point here is that homosexual relations are exclusively relations between cross cousins. Whenever one seeks information from an Indian concerning a relationship of the type just described, the typical response obtained is:

25. tarutehãdige tamindige (bl)
(those are) two brothers-in-law making love.

838 605 607 We have not been able to ascertain if these relationships of adolescence continue between adults. It seems hardly probable. But relationships of a very special nature are maintained between "brothers-in-law. They exhibit great familiarity toward one another, have among themselves effusions such as we have never noted among brothers or relatives of another degree. Among the [601] Nambikwara (always prodigious, of course, with affectionate gestures) it is not rare to see two or three men, married and fathers of families, walking in the evening tenderly embracing. The information obtained is, here too, always the same:

26. tarũhe iahaiʔete. (bl)
The brothers-in-law are embracing.

607 534 Certain games, like the "the game of claws (griffes)" (kaiyohitunuhi, c) are frequent among brothers-in-law.

of the "French who were lodged by godfathership in these villages."(5)

5. Loc. cit., XXVIII, 109.

T The indigenous institution is confirmed by Jean de Léry (6): "it is
592

6. Loc. cit. II, Ch. 20, p. 133; cf. also, Cardim, Tratado da Terra e da Gente do Brasil, Rio de Janeiro, 1925, p. 169-170.

to be noted that these words Atouaraap and Coton-anap differ, for the first signifies a perfect alliance among them and between them and us, to the extent that the goods of one are common to the other. And also that they cannot have the daughter or the sister of the first named." The "Coton-anap" is consequently, inversely as regards the preceding, privileged in two forms of marriage: that with the sister of his partner, who makes him a "brother-in-law," and that with her daughter, that is an admission to the number of maternal uncles, making of him a
N T theoretical brother of the wife, which leads to the same result.

607 [83] It is necessary to note another analogy in the relationship
171 between brothers-in-law among the Nambikwara and among the Tupi. All the texts which we have quoted agree in admitting the existence among the Tupi of a sort of authority exercised by the young men over their sisters. The marriage of cross-cousins seems to result from a mutual exchange of sisters among the men who are related in this way. The same thing can be said when the father gives his daughter to his wife's brother. Thus, actual or potential brothers-in-law are tied by a relationship of a special nature, founded on an exchange of services
N of a sexual order. We have seen that such a relationship also exists
[338] among the Nambikwara brothers-in-law, with this difference that among the Tupi these services fall back on the sisters and daughters,

N
T
607 while (besides the preceding form) the Nambikwara brothers-in-law
171 exchange payment directly in the form of homosexual relationships,
N which make up for the absence of an available sister.
T
N We may now draw a conclusion. The ancient Tupi were acquainted
171 with two types of preferential marriage: the marriage of cross-
582 cousins, and avuncular marriage. The first appeared normally in
607 the form of an exchange of sisters between two cross-cousins; the
601 second resulted from a privilege over the daughter of the sister exercised by the mother's brother, or conceded to the latter by the sister's husband. In the two cases, the marriage is based on a pact between cross-cousins, brothers-in-law in right or in fact—which is the definition which we have retained for the Nambikwara terms tarute or jopa. Moreover, this relationship of "brother-in-law" can be established under the name of chetouanap (Yves d'Evreux) or cotonamap (Léry) between individuals which no bond of kinship united before, or relatives of a different or more distant type, and even between strangers (as was the case between French and Indians). The goal was to make possible intermarriage and to amalgamate families or groups, until that time heterogeneous, into a new social unit. One recognizes the procedure which we have described in connection with the fusion of the Sabané and Tarundé (1) groups.

N
171
601

1. The South American practice of utilizing kinship relationships to translate and establish social ties is attested by Von den Steinen (Unter der Naturvölkern Zentral Brasiliens, 2 Aufl. Berlin, 1897, p. 286), whom the Bakairi had decided to call "older brother" and the Mehinaku "maternal uncle." We have just established the equality of the terms "brother-in-law" and "maternal uncle" in a system of marriage between cousins (cross-) joined to the avuncular marriage. As to the use of the term "elder brother," this calls for two observations. In the first place, the kinship system of the Bororo, who are not far distant from the Xingu, modifies each generation in two stages of which the one (elder) is assimilated to the younger members of the former generation and the other (younger) to the older members of the next generation. In such a system, an "elder brother" might be, in fact, a real uncle and a potential brother-in-law. The second point brings to a focus the logical difference between

[581] Dutemõdednige (bl), say the Nambikwara men: "it is a good
582 thing to marry." But it is not easy. The ideal marriage is the one which gives a "young and pretty woman" (monodginigere, bl) whose virginity one will have (to break the hymen: tayorõtige, bl). But such women are precisely the ones who are claimed by the chiefs or shamans, and only a few young men will have a chance to obtain such wives. The others are condemned to a long period of celibacy
●[938] which they will break by having sexual relations with their brothers-in-law, or else they will marry an "old woman" who cannot have sexual relations (tiroanebiligere, bl), one who is widowed or repudiated, whom no one wants. Such marriages are not rare among the Nambikwara, and are explained by the fundamental economic role of the couple which we have already commented on. But they are not permanent. When the young man feels his position in the group
582 strengthened, or when a better occasion is presented he abandons
584 (amnõtige, bl) his old wife to take another (ulamumõtige, bl) who
587 is younger and more seductive. It happens that a man thus marries three or four wives successively before considering himself satisfied.(1)

[71]

1. Here also, the documents of the 16th century relating to the Tupi support the comparison: "..... at times they take some old woman from whom they do not expect children, because there are no others, only so that they will cook the food, since they have no mother or sisters-in-law to take care of them, thus they are cared for, and are contented at present time with some old woman by whom they are always well treated and then taking other women by whom they have children later, either leaving the first wife or keeping her, if she wishes, for the reason mentioned above." (Anchieta, loc.cit., p. 260-261).

The repudiated woman [111] goes to live with her parents if they are still living, joins up with another man if she has the opportunity or even remains her former husband's fire, whose existence she shares and whose tasks she participates in, but in a slightly inferior position. Such is the position of b3 in the household of her ex-husband B1. Another method of obtaining the young woman desired consists of
556 seducing her, even if she is married. Adultery and more generally sentimental intrigues are very frequent among the Nambikwara.

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

string (secondary release). Four types of arrows are used: (1) featherless fishing arrow with three to five prongs; (2) bird arrow with a blunt point; (3) big-game arrow with a lanceolate bamboo point; and (4) poisoned arrow, used chiefly for hunting monkeys, with several barbs which are attached to the point with cotton wrapping and which break easily in the wound, being, therefore, usually prohibited by a bamboo sheath. The last three have a bamboo shaft and "Arara" feathering. Sewed feathering is known by the central and northern groups but seldom used. For warfare, big game arrows with serrated bamboo points are used.

Nambicuara arrow poison is a curare prepared by grating the root of a *Strychnos* shrub, and by infusing (*Eastern Nambicuara*) or boiling (*Central* and *Northern Nambicuara*) it until the water evaporates and leaves a thick brownish substance, which is smeared on a wax-coated arrow point. It can be preserved in tiny pots for several months. Among South American arrow poisons, it is remarkable because it is made of only one vegetable substance and is prepared openly—in some groups by the chief or shaman, in other groups by anyone—without magical practices or taboos. Its great toxic properties were studied by Vellard (1939 b).

Other poisons of unknown composition are used for amorous or political revenge. They are in the form of powders and are kept in tubes made of feather quills, bamboo, or other woods, each ornamented with paintings and cotton or bark wrappings.

Clubs are carved in the shape of a flattened or cylindrical pointed spade; the handle is often adorned with black and white plaiting of philodendron bark and bamboo strips. Their purpose is mostly ceremonial.

SOCIAL AND POLITICAL ORGANIZATION

Kinship terms identify parallel-cousins with siblings, and cross-cousins with potential or actual spouses. Cross-uncles and cross-aunts are called by the same terms as parents-in-law and grandparents; parallel-uncles and parallel-aunts are equated with parents. Similarly, parallel-nephews and parallel-nieces are classed with children, and cross-nephews and cross-nieces with children-in-law. Marriage is between cross-cousins or between the maternal uncle and his niece. Monogamy is the rule, but polygyny is the privilege of the chief and other important men. Polygyny is usually with several sisters (sororal) or with a woman and her daughters by a former union. The first wife runs the household, subsequent wives being assistants to the husband. The deficiency of available women which results from polygyny is compensated by homosexuality between adolescent male cross-cousins (Lévi-Strauss, 1943 a).

The village is ruled by a chief, but each of the nomadic bands into which it splits during the dry season is led by a secondary chief. Chief-

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

607 is consequently much wider than "brother-in-law" as we understand it, including as it does approximately half the masculine members of a man's generation; the rest, of course, receive the name "brother" (consanguineous or
[608] classificatory). It should be noted that in the Nambikuara kinship system men alone have brothers-in-law and, conversely, women alone have sisters-in-law.

602 Only in the case of brothers-in-law are the Nambikuara conscious of a
607 link between a special type of behavior and the position occupied by a kinsman in the relationship system. Generally speaking, there are no rules of avoidance or of privileged familiarity between particular kinds of relatives. The relations with the spouse's parents do not differ substantially from those with the parallel uncle and aunt and, although it is true that relations between consanguineous or classificatory siblings are rather reserved, the natives are unable to define this diffuse behavior. As a matter of fact, while siblings and parallel cousins do not avoid each other, they do not joke or even talk together unless there is a special reason for doing so. Sisters-in-law, on the contrary, comport themselves very freely. They laugh and joke together and render each other small services, such as rubbing each other's back with urucu paste. And, more especially, exceptional relations are revealed when one passes to the brothers-in-law.

607 We have already mentioned the partial polygyny which exists in the group.
858 The chief or shaman periodically withdraws several of the youngest and prettiest women from the regular cycle of marriages; consequently, young men often find it difficult to marry, at least during adolescence, since no potential spouse is available. The resulting problem is solved in Nambikuara society by homosexual relations, which receive the rather poetical name *tamindigu ka'dudigu*—"sham love." Relations of this kind are frequent among young men and are more publicly displayed than heterosexual ones. Unlike most adults, the partners do not seek the isolation of the bush, but settle close to the camp fire in front of their amused neighbors. Although the source of occasional jokes, such relations are considered childish and no one pays much attention to them. We did not discover whether the partners aim at achieving complete sexual gratification or whether they limit themselves to such sentimental effusions and erotic behavior as most frequently characterize the relations between spouses. In any event, the point is that homosexual relations occur only between *male cross cousins*.

We never learned whether or not the same relations continue to exist between adult cross cousins; it does not seem likely. Nevertheless, the freedom and demonstrativeness displayed by brothers-in-law toward one another are not characteristic of the relations between brothers or between the members of any other class of relatives. One often sees among the Nambikuara (who, in fact, like to indulge in expressions of affection) two or three men, married and

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

sometimes the fathers of several children, walking together at dusk and tenderly embracing each other; always

tawáky tainóiyt

(these are) brothers-in-law embracing (each other).

Certain games, too, such as the "scratch game" (in which the opponents try to scratch each other especially in the face), are commonly played by brothers-in-law.

But the close relationship between "cross cousins actually or potentially allied through a sister's marriage"—the more accurate translation of the aboriginal term for brother-in-law—may extend far beyond the family tie. Actually, it is sometimes used to establish between individuals not belonging to the same kin group new links of a special nature, the function of which is to amalgamate into a single familial unit several formerly unrelated groups. This is brought out clearly in the following case.

During the past twenty years, several epidemics nearly destroyed the central, northern and western divisions of the Nambikuara. Several groups were decimated to such an extent that they could no longer successfully maintain a socially autonomous existence. In the hope of reconstituting functioning units, some of these, therefore, attempted to join forces. In the course of our field-work we met and worked with such a merged group made up of seventeen individuals using the northern dialect (*Sabéwa* group) and thirty-four using the central dialect (*Tawándy* group). Each of the originally distinct groups, however, lived under the guidance of its own chief, although both leaders closely cooperated. It is probable that the demographic crisis did not by itself account for this situation, since the people of the second group formed merely a fraction of a more numerous unit from which it had split off for reasons unknown to us. However, from several events which occurred during our stay with them, we deduced that the break had been caused by political dissention, the details of which remained obscure to us. In any event, these groups now travelled and lived together although two separate but contiguous camps were maintained in which the families formed distinct circles, each around its own fire. The most amazing feature of this curious organization was that the two groups did not speak the same language and were able to understand one another only through interpreters; fortunately, one or two individuals belonging to each group had sufficient knowledge of the other dialect to act as intermediaries. Even the two chiefs could not communicate directly. The problem of whether these dialects belong to the same linguistic stock need not be raised here; but the Northern group undoubtedly must be classified with the Nambikuara cultural family because of the similarities of material culture and of the life pattern, and chiefly because of the psychological attitude of the people, who very evidently believed in their close affinity to the Central group.

514
515 leads to the belief that the terms employed to designate them, so
576 easily interchangeable, refer to more general forms of behavior.
515 To blow the nose, one takes in both hands a twig or a stalk of dry grass, folds it in two, and pinches the nose in this improvised nut-cracker while blowing strongly. The mucus is collected by pinching the instrument together under the nose, and the whole thing is thrown away after having been plunged into the sand to dry it.
514 The men urinate standing or while walking. The women crouch, leaning slightly forward and sprinkle themselves with sand to dry themselves. The children act like the adults of their sex, except that the little girls often urinate standing up with their legs separated. The men defecate alone in the bush neighboring the camp, the women do the same, or go in a group. On such occasions one perceives the reality of the group formed by the girls and the secondary wives of polygamous marriages. Thus, a3, a4, a5, a8, a19, and a20 are accustomed to isolate themselves by twos, threes or fours. Elimination is done in a crouched position, in a hole summarily dug in the sand with the hands, or directly on the ground. A small branch is used to clean oneself, and sand, for drying.

●541 The women are forced into isolation only at the time of their
[63] first menstruation.(1). Following this, they are only subject to

1. Cf. below, p. 109.

certain alimentary and sexual prohibitions:

6. iapoõlage edõle edõle edõle kano kano kano kano kano kanabé hulile tamãdige. (b1).
The woman has her menses every two moons (?), then she waits one day, one day, one day, one day, the next day she can eat, copulate.

The taboo on eating for five days is not rigorous, and usually concerns certain types of food. Besides this, a woman cannot bathe during her menses, as is, of course, the general rule for the two sexes during this period. One goes to the river to put water in a gourd and pours it over the body while crouching. Otherwise, the woman takes care of all her habitual occupations. No precaution is taken against
541 the flow of blood, and as no trace of it is noted, it must be supposed
147 that it is greatly reduced (2).

541
147
171 2. Among the Bororo, on the contrary, it is easily seen which women are indisposed. But the above remarks seem to be indicative of a fairly general state of affairs

841 147 171

among South-American Indians. Since the sixteenth century, travelers have often been amazed by the insignificance of the menses of Indian women. Thus: "In the period of about one year which we spent in that country, ordinarily associating with the people, we have never seen the women have their menses" (J. de Léry, Voyage faict en la Terre du Brésil, Gaffarel, Paris, 1880, Vol. II, Ch. 17, p. 92); and more recently: "no one notes when they go through certain difficult periods peculiar to their sex" (Tocantins, "Estudos sobre os Mundurucus," Revista do Instituto Historico e Geographico Brasileiro, Vol. 40, 1877, p. 113). On the other hand, the text just cited could be interpreted in two different ways: the vocal inflexion of the informant suggested that the expression edẽde edẽde edẽde signified "(this) moon (yes), (this) moon (no), (and this) moon (again)", meaning "every other moon" and not--as it is also grammatically possible--"moon, moon, moon," that is "every moon." The first sense would constitute a sort of physiological scandal, but remains, nevertheless the most probable. In fact, it is possible that the periodic indispositions are less important and more irregular among South-American women than is the case among the whites.

842 [20] The Nambikwara have a very clear idea of the relationship between sexual intercourse and conception. It is frequent that an Indian clarifies that paternity relationship is one of the blood, and not classificatory, by forming a ring with the thumb and index finger of the left hand, into which he introduces the index finger of the right hand which he glides back and forth. After this demonstration, he indicates the child saying: tagẽtte, tagẽtte, "my child, my child" (3).

3. From the same observation made by Roquette Pinto (loc. cit. p. 256) more than twenty years earlier, one can conclude that this gesture does not constitute an individual innovation, but a stylized social conduct.

842 683 197 Etymology points out the connection between the two phenomena: in the eastern dialect, "copulate" is translated nẽ'hedjatu and, in the central and southern dialects, tamẽ'hdjige, tuẽ'hatu. These three terms are attached to the respective forms [64] for "father": ahuẽ'hatu (hatu = mat, ah), tamẽ'hde, uẽ'hu. On the other hand, in the northern

881 baked manioc and other food which they have been preparing. When the messenger leaves with the food it is a sign that the men will return to camp after sunset.

Before the men arrive the women wash the girl [302, 314] and paint her with a mixture which includes latex from the rubber tree. A series of dots are painted on her face, forearms, abdomen, and thighs (pl. 6, c and d). When the men come in they dance in front of the girl's hut. She then comes out and is given a name and everyone tries to give her a necklace or some other object. During the night men and women join in the dance, holding hands and dancing in a circle, the dance steps being stamped out with the right foot in the direction in which the circle is moving. A special puberty song is also sung.

881 The Nambicuara tell of a strange medicine ● 841 known only to the shamans which is given to girls 278 during the puberty ceremony. It is a blue liquid which, when taken internally, stops menstrual bleeding for the remainder of the girl's life. The Wakitlocu claim that they do not use it but that the other Eastern Nambicuara band do. The missionaries informed me that the Kitaiche use this medicine, and the missionaries seemed to think that it was effective.

MARRIAGE

572 There is no special marriage ceremony, for 515 when young people go through the puberty rites they are ready for marriage and a mate is selected for them by their parents. The young man, who 537 is to become the husband of a girl just out of 515 seclusion, goes to her parents and helps his future father-in-law build a small hut, and when it is finished the young man tells the girl to come out hunting with him. She takes a tucum basket and they go off into the woods. In the afternoon the man builds a fire and tells the girl to prepare some food and honey. After the food has been eaten he tells the girl to come and he builds him near the fire. She is supposed to resist and he takes a stick and threatens her. He then has sexual intercourse with her, and when they come back to camp that night they are accepted as a [587] married couple. When wives are acquired by inheriting the widow of a brother or by abduction from other bands, no ceremony is held.

[p. 104 (2)]

841 147 171

among South-American Indians. Since the sixteenth century, travelers have often been amazed by the insignificance of the menses of Indian women. Thus: "In the period of about one year which we spent in that country, ordinarily associating with the people, we have never seen the women have their menses" (J. de Léry, Voyage faict en la Terre du Brésil, Gaffarel, Paris, 1880, Vol. II, Ch. 17, p. 92); and more recently, "no one notes when they go through certain difficult periods peculiar to their sex" (Tocantins, "Estudos sobre os Mundurucus," Revista do Instituto Historico e Geographico Brasileiro, Vol. 40, 1877, p. 113). On the other hand, the text just cited could be interpreted in two different ways: the vocal inflexion of the informant suggested that the expression edẽdé edẽdé edẽdé signified "(this) moon (yes), (this) moon (no), (and this) moon (again)", meaning "every other moon" and not—as it is also grammatically possible—"moon, moon, moon," that is "every moon." The first sense would constitute a sort of physiological scandal, but remains, nevertheless the most probable. In fact, it is possible that the periodic indispositions are less important and more irregular among South-American women than is the case among the whites.

● 842 The Nambikwara have a very clear idea of the relationship between sexual intercourse and conception. It is frequent that an Indian [20] clarifies that paternity relationship is one of the blood, and not classificatory, by forming a ring with the thumb and index finger of the left hand, into which he introduces the index finger of the right hand which he glides back and forth. After this demonstration, he indicates the child saying: tagétte, tagétte, "my child, my child" (3).

3. From the same observation made by Roquette Pinto (loc. cit. p. 256) more than twenty years earlier, one can conclude that this gesture does not constitute an individual innovation, but a stylized social conduct.

842 Etymology points out the connection between the two phenomena: 683 in the eastern dialect, "copulate" is translated nitnedjuta and, in 197 the central and southern dialects, tamindige, tugitan. These three terms are attached to the respective forms [64] for "father": alugitoso (toso = man, al), tamindo, nitu. On the other hand, in the northern

842 dialect, it is: "to copulate," iruia, jufreli, while "father" is uninko;
833 but one refers rather to sexual relations by the term jikijikijî, whose
197 evocative value is reinforced by an appropriate gesticulation. This term corresponds, in the other dialects, to the compounds uinikujîju (a1), iekejakâtige (b1), "to copulate with rhythmic movements." Likewise, in the western dialect, "to copulate" is expressed by ajojore, even though the demonstration evoked at the beginning of this paragraph uses the term ninfjore.

842 We have not been able to elucidate clearly the indigenous theory of conception (conceive: petnêdige, b1; from uette, "child"). It implies apparently that the sperm coagulates in the uterus and progressively forms the child. The man alone would play a positive role while the woman would be reduced to that of a simple receptacle. Nevertheless, the woman is held responsible for sterility, whether it be attributed to a particular condition or to age.

834 It is difficult to say if the numerous prohibitions attached to
842 sexual relations have as a conscious end to assure conditions favorable to reproduction, or if they depend on more remote beliefs. The first hypothesis is hardly credible, for the Nambikwara are not very eager to have children. The quest for food is too hard, too difficult, to permit the care of several children at the same time, especially when they are still incapable of taking care of themselves; and especially, during the nomadic period a woman cannot carry more than one nursing child, besides the heavy basket. Thus the first steps of the child are impatiently awaited. At any rate, several prohibitions have, as a definite goal, the limitation of sexual activity. Besides the prohibition of incest (1), it is not good to copulate "moonlit

835 1. The prohibition concerning incest is formulated as follows:

(7) tyaîde takenaîde tamfndige manhatte (b1)
for a sister and brother to copulate is bad

[c 844] but it does not seem that the infractions are punished other than by collective disapproval. A very equivocal attitude concerning a couple (A71 and a72) and the use, in their regard, of kinship terms communicated with repugnance, and manifestly contradictory to the system, makes one believe that it could be a case of parallel cousins. We have not been able to find a sure case of incest between blood relatives.

nights" kanaro'etẽndige (b1); inversely, nights without moon are particularly approved, as well as rainy periods. In 1938 the rains were late, and the first shower came in September after six months of total drought. The event, so long awaited, was immediately celebrated by B1, who did not even wait for night to have sexual relations with his youngest wife b2. However, day-time relations are rare, and the act was carried out more ostensibly than usual, behind the thin palms of a shelter. Immediately afterwards B1 supplied a spontaneous commentary on meteorological prohibitions. Sexual relations are also, at least theoretically, forbidden between husband and wife [65] from the birth of the child to the time when he can walk. This event is hurried along by rubbing his legs with the juice of a non-identified plant (tourí?iri, c) "so that he will walk quickly" so that another can be made" (1); but, by "another," is understood, un-

1. The same custom existed among the ancient Tupí. Cf. Cardim, Tratado da terra et da gente do Brasil, new ed., Rio-de-Janeiro, 1925, p. 170.

doubtedly sexual intercourse rather than their result, rarely welcome: the Nambikwara women often have recourse to abortion, and they are familiar with a great number of plants and roots for that use. We were not able to obtain a specimen.

The attitude of the Nambikwara toward things pertaining to love can be summed up in their formula tami'ndige mõndage, translated literally, if not elegantly: "To make love is good." We have already mentioned the erotic atmosphere which fills daily life. Love affairs hold the interest and curiosity of the Indians to the highest degree. They are eager for conversation on these subjects, and the remarks exchanged in the camp are filled with allusions and hidden meanings. However, sexual relations are rare, and the prohibitions which limit them explain this state of affairs only partially. The thing truly responsible seems rather to be indigenous temperament. In the course of the amorous games to which couples give themselves over so willingly and so publicly, and which are often very far advanced, we have never been able to note the beginning of an erection. The pleasure looked for seems to be less of the physical order than playful and sentimental. Sexual relations usually take place at night, and often not far from the fires of the camp. More often the couple draws back about a hundred meters into the neighboring bush. This departure is noted immediately, and gives rise to the most

854 11. kalajodné daé jo?dnobere (b1)
Take it from the front! Take it from the back!

Or else, amidst great bursts of laughter, she takes the child and pretends to be going to throw him to the ground:

12. ?ãndam nõm tebé ãhiju (b1)
(The mother) "I am going to throw you!" (the child) "I don't want to!"

855 593 Reciprocally, the children surround their mother with a tenderness that is demanding and sometimes unquieting. At the time of leaving group b1, we jokingly proposed to a little girl (b5) that we take her with us. Her response was very characteristic, and at the same time similar to that which many other children would have made under the same circumstances:

13. hõdnjé odengenãhjen ?uadã?en tanãhnãdaje. (b1)
No! I don't want to go! I am afraid! Mama would cry!

And another observation also makes evident the affection which is always present on the part of the child: a father (C20) brings wild honey and begins by giving some to his son (C22), and only then to his wife (c21); the child, worried, watches his father's movements to see if his mother will receive her share.

[842] 855 593 During the period which precedes weaning, the child lives in as great intimacy with his father as his mother. Like the latter, the father takes care of him, holds him in his arms, wipes up his excrement when necessary, etc. Later, the child lives closer to his mother. She carries him on trips till he can walk, and later he walks at her side. He remains with her at camp or village while his father goes hunting. However, the proprieties of relationships depend first of all on the sex of the child. A father shows more interest in his son than in his daughter, since he must teach him the masculine techniques and occupations: and the same thing is true concerning relationships of a mother and daughter. But as a whole, the relationships of the father with his children show the same [843] tenderness and solicitude that we have previously mentioned. The father plays with his child while carrying him on his shoulder (alakuiriginare, b1). He makes weapons to fit the size of the child's little arms:

14 mifnde tauirétnore ikõlãagetire (b1)
The father makes arrows for the child.

736 [69] Concerning a young male orphan, nearly an adolescent, it was said to us one day that "he does not go hunting because he has no father to make him a bow." In certain cases, the father must extend his care and, to a certain degree, substitute for the absent

[734] wife. We have already cited the case of the two little girls
543 a8 and a9 whose stepmother (a7) refuses to take care of them.
Their father (A6) must, then, assume many of the lesser func-
● [742] tions. At the time of departure for a trip, it is he who prepares
the basket for the elder, measures on her the length of the tump
line, and shortens it thanks to the free end which he fastens
passing it several times through the holes of the basket-work.
549 It is also the father who tells the children the traditional stories.
538 And, with a view to shortening and making more intelligible
these often long and repetitious accounts, he applies himself
to transposing them in a style especially adapted for children.
Thus, the infant's version of the story of the Flood (1) is as

1. See below, p. 120, the complete version of this story.

follows:

15. wititento dohonenãtram kãnaram hẽpatnẽ atãtene
wejdenkjathatteme wafndwile. (bl)
Everyone was dead! There was no one left! Not a man!
Everyone was dead! Nothing more!

595 Relationships of a particular nature exist in the case of
571 polygamous marriage between the children of the first wife and
their young stepmothers. Even though the latter are called
"mother" or of "sister of the mother" by them, they live in a
state of companionship with them, especially with the girls,
which also extends to all the children of the group. We have
already dwelled on this society of girls and young wives who
take collective baths, go to defecate in a group, smoke to-
gether, joke and give themselves over to rather farfetched games,
such as spitting long jets of saliva in one another's face. An-
other example: a3 and a4 play with their stepdaughter a5. One
of them pushes her and throws her to the ground with such
violence that her head cracks against the ground and the little
one begins to shriek. The two young women heap mockeries
upon her. Finally, the youngest goes to drag her from the
ground almost by force and pushes her toward her mother, with-
out ceremony, like a package. These relationships are close,
appreciated, but without courtesy, like those which young boys
might have in our society. They rarely imply service or atten-
tion. Thus, A1 and his polygamous wives a3 and a4 divide a

TN 601 171 The reader will find other indications concerning the assimilation of the brother of the father to a classificatory father in Soares de Souza (4).

4. "Roteiro do Brasil," Revista do Instituto, etc., Vol. XIV, 1851, p. 316-317.

TN 601 552 171 The old authors often describe the marriage of cross-cousins among the Tupi, as well as that of uncle with niece. Here again we shall first refer to Anchieta:

"They do not call daughters of sisters temerico eté, nor are they considered as such; because many Indians, since they have several nieces—and very attractive women they are—do not make use of them; but since brothers have so much power over sisters, they consider that [81] nieces belong to them (the brothers), so that they may consider them as wives and use them ad libitum if they so desire, just as they give their sisters themselves to some men and take them away from others. Tarageaf, a very important Indian of the village of Jaribiatiba, which is in the area of São Vicente, had two wives, and one of them was his niece, daughter of his sister..."(1)

1. Loc. cit., p. 259.

Farther on, the two types of marriage are seen as symmetrical institutions: "...porque os pais lhes dão as filas e os irmãos as irmas." Staden also alludes to the marriage of cousins: "They also offer as a gift their daughters and their sisters." (2) The same type of thing is

2. Hans Staden, The true history of his captivity (ed. Malcolm Letts), London, Vol. II, Ch. 18, p. 146.

TN [342] found in Soares de Souza, Claude d'Abbeville and many others. With a sharp sociological sense, Anchieta discovers a connection between the marriage with the sister's daughter and the recognition of the man as alone responsible for conception. One remembers that this theory is also shared by the Nambikwara:

"Since they respect the daughters of brothers, they call them daughters, and consider them as such; and thus they consider them inviolate because they have a true relationship, coming from the [342] father, who is the agent; and the mothers are nothing more than

I: Lévi-Strauss--93 E-6 (1908-1939)1948 SP17 Nambikwara SP17
Tupinamba SD1

receptacles with respect to the fathers, receptacles in which children are deposited, and for this reason the sons of fathers, if they are born of slaves or captives taken from another tribe, are always free and just as esteemed as the others; and the sons of women, if these sons are begotten by captives, are considered slaves and are sold, and sometimes they kill and eat them, even though they may be their own grandchildren, sons of their daughters, and for this reason also they use the daughters of sisters with no prejudice at intercourse, but there is no obligation or universal custom to consider them as true wives, more than the others, as has been stated above. And for this reason the fathers marry them now to their uncles, brothers of the mothers, if the parties are agreeable, by virtue of the power which they have to deal with them as they wish, something which until now is not done with nephews, sons of brothers, nor even in other relationships which are more distant and which come through the line of the fathers, because among the Indians this is considered very strange." (3)

3. Loc. cit., p. 259-260.

Without doubt the marriage of cross-cousins is widespread throughout the whole of South America. (4) But among the Tupi it

4. Thus Breton, concerning the Caraïb of the Antilles says: "First cousins whom we call sons of the brothers of the father are called brothers, and these brothers of the father are also called fathers; and the children of these brothers do not contract alliances together, but rather with the children of the sisters of their fathers." (Dictionnaire Caraïbe-François, Auxerre, 1665, p. 11.)

was rather avuncular marriage which held the attention of the first travelers. Thus, Léry notes: "As for the uncle, he takes his niece" (as a wife); and Thevet: "From the time they are born, the maternal uncle raises them and retains them for future wives." (5) Magalhães

5. Léry, loc. cit. II, Ch. XVII, p. 85;
Thevet, Cosmogonie universelle, p. 932.

de Gandavo expresses himself inexactly, without doubt, but [82] in

649 which cause sickness, they have given the magical herbs whose smoke blinds the dangerous evil eye, and the techniques which will drive away the storms. Thus the shaman operating on a symbolic level continues the struggle for survival which has been defined for the Nambicuara by the nature of their adjustment to their physical environment and their relationships to one another.

THE LIFE CYCLE

BIRTH

833 The Nambicuara recognize sexual intercourse (coitus) as the cause of pregnancy (fecundation). This act takes place in the woods while the husband and wife are out hunting or collecting, for it is considered improper to have sexual intercourse in public, even at night around the common camp fire. If a shaman should see a couple in sexual embrace while practicing his rites it would spoil his power. Although shamans use a special hut when calling their evil eye there is always a chance that they may see a couple in the sexual act, so every effort must be made to avoid this danger. Shamans themselves abstain from sexual intercourse for 2 or 3 days before getting in contact with the spirits.

843 There appear to be no food taboos surrounding pregnancy among the Wakitáun. The husband continues hunting and collecting as usual, but he must avoid working too hard in the field for fear of causing his wife to abort. Women do not practice abortion, and the Nambicuara did not mention any medicines used for this purpose. Honey is considered conducive to sexual vigor and is used by young couples. Childless marriages are attributed to sterility in women, and a man may abandon his wife for this reason.

844 Birth takes place in the house, or in the camp if the family is out hunting. Just before expecting the birth of a child the expectant mother drinks the juice of certain herbs which are believed to facilitate birth. The husband and two older women assist in the delivery. The woman kneels on the ground and is supported by her husband. The umbilical cord is tied with a certain vine and then cut with a bamboo sliver. Among the Kitãnihu it is bitten off by one of the midwives. The placenta is buried at the place of birth and when the umbilical cord dries and falls off, it, too,

SP17 Nambicuara SP17

In questions of relationship they never use the word *ete* (true) since they call their father's brothers "father," their brothers' sons "son," and their father's brothers' sons "brother"; when they wish to designate their actual father or son, they say *aruale amandengara* "my father who engendered me," or, for a son, *amaire amandengo* "my son whom I engendered." I never heard an Indian call his wife *amandengo ete*, but simply *amandengo* or merely "mother of my children," and I never heard a woman refer to her husband as *amandengo* "real husband," but simply *amandengo* or *amandeiro* calls "father of my children." They use these terms indifferently for their husband or lover. If the husband calls one of his wives *amandengo ete*, he means the most esteemed or best loved wife and she is often the last one he took.[5]

This text also shows that the Tupi encountered a difficulty in their kinship system, namely, how to distinguish the classificatory parents or children from the consanguineous ones. This stresses the structural similarity between their kinship system and that of the Nambikwara, since the latter met with the same problem. Apparently the Tupi, like the Nambikwara, felt no need for special terms, but when it was necessary, made comments based on physiological considerations. When the Nambikwara are asked to point out the real status of their consanguineous children, they add to the name for "son" or "daughter" another word, the meaning of which is "child" or "little one." The physiological implication of this new term is perfectly clear, since is is ordinarily used to designate newly born animals, while the former terms are applied only to relationships within the human family. Complementary indications regarding the assimilation of the father's brother to a classificatory father may be found in Soares de Sousa.[6]

The old authors give numerous examples of cross cousin marriage and of marriages between uncles and nieces. Here again Anchieta will be our main source:

> Though many Indians have several nieces, and very attractive indeed, nevertheless they do not use them as wives. However, brothers have such authority over sisters that they consider their nieces as belonging to them and that they are entitled to marry them and to use them ad libitum if they wish. In the same way they give their sisters to some and refuse them to others. Tarugua[ç], an important chief of the village of Jurubatiba in the plain of San Vicente, had two wives one of whom was his niece, his sister's daughter.[7]

Both types of marriage are treated as symmetrical institutions in the same document: "... because the fathers give them the daughters and the brothers the sisters...."[8] Furthermore, cross cousin marriage is referred to by Staden:

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

"They make presents also of their daughters and sisters . . . ",[1] by Soares de Sousa,[2] Claude d'Abbeville,[3] and others. With a sound sociological feeling, Anchieta establishes a link between the custom of a man marrying his sister's daughter and the recognition of the male as the only one responsible for conception, a theory also shared by the Nambikuara. On this matter, Anchieta writes:

They call the brothers' daughters "daughter" and treat them as such. Therefore they would not have sexual intercourse with them, since they believe that the true kinship link has its origin in the father, whom they consider the only agent, while the mother, according to them, is merely a container in which the children are formed. . . . For that reason too, they use the sisters' daughters "ad copulam" without sin. . . . For the same reason, the father will give his daughters in marriage to their uncles, their mother's brothers, a thing which, until now, was never done with the nephew who is the brother's son. . . .[4]

Cross cousin marriage seems to have a very wide distribution throughout South America.[5] But among the Tupi *avunculate* marriage in particular aroused the interest of early travellers. For instance, Léry notices: "As to the uncle, he marries his niece";[6] and Thevet: "As soon as they are born, the maternal uncle lifts them from the ground and keeps them for his future wives."[7] Magalhaes de Gandavo expresses himself as follows:

It is their custom to marry the women who are their nieces, the daughters of their brothers or sisters; these are considered their legitimate and true wives. Fathers of the women cannot refuse them, nor can any persons other than their uncles marry them.[8]

But this statement seems to be doubly inaccurate. For other references to the same phenomenon one may turn to Nobrega,[9] Vasconcellos,[10] and Soares de Sousa.[11]

649 which cause sickness, they have given the magical herbs whose smoke blinds the dangerous entities, and the techniques which will drive away the storms. Thus the shaman operating on a symbolic level continues the struggle for survival which has been defined for the Nambicuara by the nature of their adjustment to their physical environment and their relationships to one another.

THE LIFE CYCLE

BIRTH

833 [872] The Nambicuara recognize sexual intercourse (wiarisendakira) as the cause of pregnancy (kaiki'rira). This act takes place in the woods while the husband and wife are out hunting or collecting, for it is considered improper to have sexual intercourse in public, even at night around the common camp fire. If a shaman should see a couple in 756 sexual embrace while practising his rites it would 833 spoil his power. Although shamans use a special hut when calling their entities there is always a chance that they may see a couple in the sexual act, so every effort must be made to avoid this [834] danger. Shamans themselves abstain from sexual intercourse for 2 or 3 days before getting in contact with the spirits.

● 843 There appear to be no food taboos surrounding pregnancy among the Wakitian. The husband continues hunting and collecting as usual, but he must avoid working too hard in the field for [847] fear of causing his wife to abort. Women do not practice abortion, and the Nambicuara did not mention any medicines used for this purpose. [832] Honey is considered conducive to sexual vigor and is used by young couples. Childless marriages [893 586] are attributed to sterility in women, and a man may abandon his wife for this reason.

844 Birth takes place in the house, or in the camp if the family is out hunting. Just before expecting [824] the birth of a child the expectant mother drinks the juice of certain herbs which are believed to facilitate birth. The husband and two older women assist in the delivery. The woman kneels on the ground and is supported by her husband. The umbilical cord is tied with a certain vine and then cut with a bamboo sliver. Among the Kitãnzhe it is bitten off by one of the midwives. The placenta is buried at the place of birth and when the umbilical cord dries and falls off, it, too,

291 around the ankles. The Tagnani and Tawite wear similar bands on
189 their upper and lower limbs; theirs, however, are made of cotton, which is used occasionally by the Cocozu to manufacture articles of this sort. [Plates p. 242.] Among the Tagnani and Tawite [238], men often cover their sexual organs with the ends of the straw cord that encloses their hips. But this is not the rule. The Uainaçu rarely wear any of those bands; and among all groups, a few of the Indians always go completely naked.

[Fig. 29]

297 The women and pubescent girls, young and old, single and married, always wear the hip cord.

[292] Some pregnant women I saw did not wear it; I believe they had freed their abdomen from this strong pressure in order to breathe more easily, or perhaps for fear that the girdle should have a pernicious influence on the foetus.

302 They always wear their hair long, hanging over the shoulders; they clip it irregularly on the forehead with a bivalve shell or a cane splinter. They liked to have us cut it with scissors.

291 They are extremely fond of the hats we wear; it seemed to me that the heat of the sun on their head distressed them greatly. They will give almost as much for a hat as for an iron axe.

301 One of the jaguar-hide helmets which are now in the [National] Museum was obtained in the village of Ururau in exchange for an old and well-worn hat of ours, in spite of the fact that those helmets are highly prized [by the Indians].

They do not normally wear hide or feather head ornaments. When they are in a festive mood, they cover themselves with crowns [diadems] that will be described later, or with jaguar-hide helmets. It is likely that they also use such ornaments for certain ceremonies, but we ascertained nothing about this.

[Fig. 32]

[240] From their ears they hang triangles of mother-of-pearl, [304] which they extract from river shells; when the hole tears, splitting the lobe in two, they do not hesitate to bbore another one.

[562] The men are much vainer than tthe women; they adorn themselves with feather diadems, earrings, peendants and necklaces, while the women limit themselves to a few of tthese.

539 (arétasu-ahétu), and the connection remains suspect, the Nambikwara
701 not disdaining puns. (1) The same thing goes for the flutes of Pan,
[12]
[23]

1. For example, Al mocks me when I am in the process of smoking: Kahedetu ehedetu: a smoker is lazy.

sometimes called dui'dru (a1/2) dui'dude (b1) which would also be the name of the animal agouti (Dasyproctas agouti). It is no less true that
[33] several of the songs collected have been pointed out as songs of the hunt or of the harvest. A soldier of the Rondon Commission, prisoner of the Nambikwara for quite a long time, described to Roquette Pinto (2) a ceremony composed of dances and songs which had

2. Loc. cit., p. 234-235.

followed a tapir hunt. And a musical theme was pointed out to us spontaneously as the song of the tapir hunt.

FROM BIRTH TO DEATH

574 The Nambikwara woman gives birth (to be born: taiʔtige, b1) in a crouching position and getting support on the ground by means of a vertical pole which she holds with both hands. During this time a companion pours cold water over the chest and stomach with a small gourd. The umbilical cord is cut close and cauterized with a live coal, then covered with a salve of warm ashes.

47. dõtu saikedutu ikedatelusu alõtu uaiʔnkedjutu inketu
iakesajutu ire ire iagekediutu (a1)
[When] the woman gives birth the placenta is buried in the bush; she is ill, she does not eat [for] a moon, a moon [and then] she eats again.

846 After the ceremony of burying the placenta, consequently, the woman would remain for two months under a taboo and condemned to relative abstinence. In reality, an exceptional situation is prolonged much longer, the period of abstinence observed by the husband and wife until the child is weaned, or at least until he ceases to be exclusively nourished by the mother's milk.

To describe the state of abstinence (inkatu, "one is ill" [a1]; there is no special term), we can do no more than to transcribe our observations made from day to day relative to the family of fire 6 composed of A21, a22, and a23. a22 is clearly distinguished from her companions:

2: Lévi-Strauss E-S (1938-1939)1948
SP17 Nambicuara SP17

chiefship is not hereditary; the chief, when old or sick, designates his successor from the oldest men of the group. The chief's authority is slight; it depends wholly on the good will of the family heads.

Relations between neighboring bands are inspired both by fear and by the desire to exchange goods. Warfare, therefore, is closely connected with barter. Groups not acquainted with each other use ritual speech when they meet.

Before starting a war expedition, a divinatory rite is performed with special songs and dances. An arrow is hidden by the shaman, the outcome of the expedition being presaged by its appearance the following day.

LIFE CYCLE

Childbirth.—After the delivery of a child, the placenta is buried in the bush and both parents are subjected to rigid prohibitions concerning food, the use of ornaments, and social contacts.

Puberty.—The initiation rite for young men consists of piercing their lips and nose and giving them their adult personal name. At her first menstruation, a girl is isolated for several months in a special shelter outside the village, where she is given ritual food by her mother. At the end of the rite, she takes a long bath in the river; this also constitutes the first step of the marriage ceremony.

Both cross-cousin and avuncular marriages (see p. 367), are often planned by parents for their infant children. Marriage is celebrated by festivals, banquets, and dances. The union is pronounced by the chief. Fish and fishing are important both before and during the ceremony.

Separation is frequent, the chief cause being that the man seeks a younger and prettier woman. There is no social sanction of adultery, except that the seducer is advised by his companion to go away for a while so as to avoid the husband's revenge. A murderer also fears vengeance.

Death.—Some groups of *Nambicuara* bury their dead in a circular pit, the corpse being placed in a crouching position. Others leave the corpse to decompose in an elongated ditch and later wash the bones in the river, put them in a basket, and bury them in the village, which is then abandoned. Weapons, implements, adornments, and other property of the deceased are destroyed, but his garden—if he owned one—is abandoned only for a few months. Later anybody may cultivate it.

ESTHETIC AND RECREATIONAL ACTIVITIES

Art.—Most *Nambicuara* groups are completely ignorant of drawing, although some groups decorate calabashes with dots and straight and sinuous lines. These are conventionalized reproductions of realistic designs found among other groups.

[69] which cause sickness, they have given the magical herbs whose smoke blinds the dangerous embers, and the techniques which will drive away the storms. Thus the shaman operating on a symbolic level continues the struggle for survival which has been defined for the Nambicuara by the nature of their adjustment to their physical environment and their relationships to one another.

THE LIFE CYCLE

BIRTH

833 [832] The Nambicuara recognize sexual intercourse (wiretesukitra) as the cause of pregnancy (kaikitra). This act takes place in the woods while the husband and wife are out hunting or collecting, for it is considered improper to have sexual intercourse in public, even at night around the common camp fire. If a shaman should see a couple in sexual embrace while practising his rites it would 756 833 spoil his power. Although shamans use a special hut when calling their endowe there is always a chance that they may see a couple in the sexual act, so every effort must be made to avoid this danger. [834] Shamans themselves abstain from sexual intercourse for 2 or 3 days before getting in contact with the spirits.

843 There appear to be no food taboos surrounding pregnancy among the Wakitisu. The husband continues hunting and collecting as usual, but he must avoid working too hard in the field for [837] fear of causing his wife to abort. Women do not practice abortion, and the Nambicuara did not mention any medicines used for this purpose. [832] Honey is considered conducive to sexual vigor and [833 is used by young couples. Childless marriages 834] are attributed to sterility in women, and a man may abandon his wife for this reason.

● 844 Birth takes place in the house, or in the camp if the family is out hunting. Just before expecting [824] the birth of a child the expectant mother drinks the juice of certain herbs which are believed to facilitate birth. The husband and two older women assist in the delivery. The woman kneels on the ground and is supported by her husband. The umbilical cord is tied with a certain vine and then cut with a bamboo sliver. Among the Kitaulhu it is bitten off by one of the midwives. The placenta is buried at the place of birth and when the umbilical cord dries and falls off, it, too,

841 is buried in the camp. The child is bathed, and
[309] tiny washers made of tucum nut hull are placed
on its ear lobes. The washer or ring is cut on
an angle so that the two points eventually press
through the lobe creating a hole. As the child
grows, new washers are added. After a few weeks
[551] the child is given a beaded necklace, but it is not
named, being known only as the child of so-and-so
until puberty, when it receives a name. The
Wakihlisu appear to have no avoidances following
the birth of a child, although the Kitaulu are
[845] said to practice a modified form of couvade.
Twins are accepted with satisfaction. Illegitimate
[849] children are likewise accepted and are cared for
by the girl's parents until she marries. No stigma
appears to be attached to an unmarried mother;
however, this attitude may be a recent develop-
[845] ment. Crippled or malformed babies are not
[847] killed, but usually die shortly after birth.

Children are nursed until they are 2 or 3 years
853 old or until another child is born. Women in the
band assist one another in nursing and taking
care of the infants. If a woman should have two
small infants, another woman who has lost her
854 child will nurse one of them. Small children are
carried on the hip of the mother, sitting on a
strap which passes over the opposite shoulder of
the mother. This strap which is made from
embira bark or woven cotton is about 4 inches in
width. Women evidently are accustomed to
carrying heavy loads, for on many occasions the
tiny women were observed carrying not only their
child but also a huge burden basket full of fire-
wood. When the child gets a few teeth it begins
to chew on a piece of broiled meat. One morning
while Kaoro and I were debating what to do with
a rat which we had caught in a box trap the
night before, neither of us having the courage to
put our hand in the box, one of the missionaries
suggested we give it to the Nambiquara. Kaoro
then carried the box over to Julio's camp and gave
853 it to one of his wives. Without any hesitation
252 the woman put her hand in the box, pulled out
the rat, banged its head on the box, and threw it
on the coals of her fire. After the hair had been
partially singed off she pulled it out, cut off its
tail with her thumb nail, and gave it to her
cowife's baby, who began sucking on it as if it
had been a piece of candy. Then with her thumb

252 They spread saliva on bándcodíú sores with the palm of the hand. They squeeze insect bites between two fingers.

757 Those suffering from fever go quietly into a corner, when they do not leap into running water. They eat nothing as long as the seizure lasts.

In the village on the Juina River there was an old Indian of about sixty. He was sad and prostrate and was not cheered by our gifts. He would put his hands to his head to show that it was aching. A lad who seemed [251] to be his son judging by the extreme affection he bestowed on the old man, contrary to the other Indians, kept offering him honey with water. Each time the old man would turn away. In the afternoon, his condition not having improved, he called the boy and said something to him.

The lad grasped the man's head in his hands and put his mouth against the nostrils, sucking hard. It seems that this suction which he repeated later was helpful, for the old man became more expansive.

[Fig. 41]

353 Childbirth must be easy, considering how poorly the foetus is nourished. The Indian women, when they do not have sufficient milk, take a drought of water in their mouth and put their lips onto those of the baby, transferring the liquid in a nourishing k'u.

354 I wanted to know how they cut the umbilical cord and showed several Indians who were more outgoing and intelligent--Damasceno, Nulaike, Krikricoimerá--a drawing in a book that showed a foetus with its attachments. From Damasceno's replies I understood that the mother cuts the cord with her teeth and hides the placenta under some leaves.

This piece of information obviously remains subject to revision.

531 Drawings by the Indians of the Serra do Norte, though rudimentary, reveal some interesting motifs emancipated from animal forms.

The circle, triangle and square are drawn in black on the surface of some gourds.

[532] [252] Snakes and saurians are sometimes drawn sketchily(1)

113 1. See E. Roquette-Pinto, "Documentos para o estudo da psicologia dos Indios do

is buried in the camp. The child is bathed, and tiny washers made of tucum nut hull are placed in its ear lobes. The washer or ring is cut on an angle so that the two points eventually press through the lobe creating a hole. As the child grows, new washers are added. After a few weeks the child is given a hundred necklaces, but it is not named, being known only as the child of so-and-so until puberty, when it receives a name. The Wakihiru appear to have no avoidances following the birth of a child, although the Kitaulu are said to practice a modified form of couvade. Twins are accepted with satisfaction. Illegitimate children are likewise accepted and are cared for by the girl's parents until she marries. No stigma appears to be attached to an unmarried mother; however, this attitude may be a recent development. Crippled or malformed babies are not killed, but usually die shortly after birth.

Children are nursed until they are 2 or 3 years old or until another child is born. Women in the band assist one another in nursing and taking care of the infants. If a woman should have two small infants, another woman who has lost her child will nurse one of them. Small children are carried on the hip of the mother, sitting on a strap which passes over the opposite shoulder of the mother. This strap which is made from embira bark or woven cotton is about 4 inches in width. Women evidently are accustomed to carrying heavy loads, for on many occasions the tiny women were observed carrying not only their child but also a huge burden basket full of firewood. When the child gets a few teeth it begins to chew on a piece of broiled meat. One morning while Knave and I were debating what to do with a rat which we had caught in a box trap the night before, neither of us having the courage to put our hand in the box, one of the missionaries suggested we give it to the Nambicuara. Knave then carried the box over to Julio's camp and gave it to one of his wives. Without any hesitation the woman put her hand in the box, pulled out the rat, banged its head on the box, and threw it on the coals of her fire. After the hair had been partially singed off she pulled it out, cut off its tail with her thumb nail, and gave it to her cowife's baby, who began sucking on it as if it had been a piece of candy. 534 (arãtasu-ahãtu), and the connection remains suspect, the Nambikwara
789 not disdaining puns. (1) The same thing goes for the flutes of Pan,
[12]
[522]

1. For example, A1 mocks me when I am in the process of smoking: Kũkedetu ũkedetu: a smoker is lazy.

sometimes called duʔũru (a1/2) duʔũnde (b1) which would also be the name of the animal agouti (Dasyproctas aguti). It is no less true that
[503] several of the songs collected have been pointed out as songs of the hunt or of the harvest. A soldier of the Rondon Commission, prisoner of the Nambikwara for quite a long time, described to Roquette Pinto (2) a ceremony composed of dances and songs which had

2. Loc. cit., p. 234-235.

followed a tapir hunt. And a musical theme was pointed out to us spontaneously as the song of the tapir hunt.

FROM BIRTH TO DEATH

874 The Nambikwara woman gives birth (to be born: talĩttige, b1) in a crouching position and getting support on the ground by means of a vertical pole which she holds with both hands. During this time a companion pours cold water over the chest and stomach with a small gourd. The umbilical cord is cut close and cauterized with a live coal, then covered with a salve of warm ashes.

47. dõsu saĩkedutuʔãkedatelusu alõsu usĩĩnkedjutu inketu iakessũtutu ire ire iagekediutu (a1)
[When] the woman gives birth the placenta is buried in the bush; she is ill, she does not eat [for] a moon, a moon [and then] she eats again.

846 After the ceremony of burying the placenta, consequently, the woman would remain for two months under a taboo and condemned to relative abstinence. In reality, an exceptional situation is prolonged much longer, the period of abstinence observed by the husband and wife until the child is weaned, or at least until he ceases to be exclusively nourished by the mother's milk.

To describe the state of abstinence (inkãtu, "one is ill" [a1]; there is no special term), we can do no more than to transcribe our observations made from day to day relative to the family of *fire 6* composed of A21, a22, and a23. a22 is clearly distinguished from her companions:

846 784 1. She wears no decoration or ornament;

[107] 2. She does not touch food, neither to harvest it, to gather it, to prepare it nor to cook it;

3. She speaks to no one and no one says a word to her;

4. She avoids groups and when curiosity draws her toward our circle, she attends the distribution and exchange of gifts from a distance and in silence. If someone gives her or her husband a present (for example some beads), it is immediately given to the baby;

5. Every day she receives her food from her mother (a18), who gives it to her without speaking, and occupies herself with certain cares of the baby such as delousing it;

6. She does not bathe in the river, but washes herself with the water which she herself goes to draw in a gourd;

7. She goes away with her husband, sometimes for whole days, and, upon departure, follows him at a distance without saying a word; on these occasions, she takes the baby along;

A21 behaves similarly:

1. He does not go with the masculine group when they go hunting or gardening;

2. He rarely goes away, and then with his wife. The rest of the time he spends stretched out without taking part in any creative activity; they say he is ill (inkatu);

[162] 3. In the degree to which he and his wife perform the most indispensable activities, there is no division of labor between them. Either one buries the baby's excrement, or places in the coals the manioc received by a22 and a18 which constitutes their sole nourishment. Both are extremely thin, and appear very weak; their hair has not been cut or washed for a long time.

Toward June 20, 1938, this behavior was modified. For three consecutive days A21 and a22 disappeared for the whole day, doubtless to hunt, for, after several fruitless trips, they return (June 23 at 15 o'clock) with the following small game:

a. An irara (Mustela sp.);

b. Three bats;

c. Two lizards and their eggs.

846 252 The irara and the bats have already been put over the flame to burn off the hair. a22 begins immediately—and for the first time—to clean and crush a small quantity of manioc and she quickly puts a cake under the coals. At the same time she puts the broken lizard eggs there, and [108] takes them out barely cooked; she divides

846 252 them between herself and the baby. For the first time, she exchanges some words with her neighbors while laughing.

846 252 224 In the meantime, A21 has cleaned the irara. He gives the stomach, the large intestine, the small intestine to a2 (wife's sister); she, aided by her daughter a5, cleans the intestines, puts them on to cook and begins to eat them with a5 and a3.

A21 cuts the tail of the irara, cooks it rapidly, and eats it with his wife and baby.

The three bats have been given to a2 (wife's sister) and a14 (sister), who divides her lot with her son A16 and her son-in-law A15. a22 cooks the lizards and the organs (liver, heart, lungs, spleen, kidneys of the irara). She gives the whole thing to her husband, who gives a piece of liver to the baby and divides the rest with his wife.

All of these operations are carried out very rapidly in a sort of hurry, and are finished at the end of a half-hour. At 30 minutes past 15 o'clock, a22 lights a different fire from the one that each household uses, and places the irara there. She then goes to take her first bath in the river, and brings back some water in a gourd to wash the baby. Toward 16:15 the cooked irara is taken from the fire by A21. At this moment everyone has returned to camp and has taken his habitual place. A21 and a22, seated near the new fire, occupy a central position. A21 cuts the irara into five pieces and divides it among the members of the family, as was said previously. (1)

1. Cf. above, p. 74 f.

From that time on, A21 and a22 take up normal activity and are no longer distinguished from their companions.

846 Thus the period of abstinence is characterized by relative isolation of the couple in question, which is at the same time under a certain number of taboos (social contacts, baths, preparation of food, dress, eating of certain foods). It ends at the moment when the child takes its first meal not consisting solely of milk (in this [224 862] case the lizard eggs and the irara liver. This meal is part of a hunting feast offered to the group by the parents who up to now were under the taboo. However, the atmosphere in which these operations are carried out merits attention. No solemnity surrounds them, and the parties concerned perform them with the same routine and nonchalance which characterizes daily activities. It is not a question then of a ceremony with the psychological implications which this term carries, but of a collection of acts which must be done, and are done, with a minimum of attention accorded to their exceptional character.

834 nights" kanaro?etẽndige (b1); inversely, nights without moon are
842 particularly approved, as well as rainy periods. In 1938 the rains
834 were late, and the first shower came in September after six months of
[833] total drought. The event, so long awaited, was immediately celebrated by B1, who did not even wait for night to have sexual relations with his youngest wife b2. However, day-time relations are rare, and the act was carried out more ostensibly than usual, behind the thin palms of a shelter. Immediately afterwards B1 supplied a spontaneous commentary on meteorological prohibitions. Sexual relations are also, at least theoretically, forbidden between husband and wife
[856] [65] from the birth of the child to the time when he can walk. This event is hurried along by rubbing his legs with the juice of a non-identified plant (touri?iri, c) "so that he will walk quickly, so that another can be made" (1); but, by "another," is understood, un-

[71] 1. The same custom existed among the ancient Tupi. Cf. Cardim, Tratado da terra et da gente do Brasil, new ed., Rio-de-Janeiro, 1925, p. 170.

doubtedly sexual intercourse rather than their result, rarely welcome:
● [847] the Nambikwara women often have recourse to abortion, and they are familiar with a great number of plants and roots for that use. We were not able to obtain a specimen.

831 The attitude of the Nambikwara toward things pertaining to
832 love can be summed up in their formula tamĩndige mõndage, translated literally, if not elegantly: "To make love is good." We have already mentioned the erotic atmosphere which fills daily life. Love affairs hold the interest and curiosity of the Indians to the highest degree. They are eager for conversation on these subjects, and the remarks exchanged in the camp are filled with allusions and hidden
[833] meanings. However, sexual relations are rare, and the prohibitions which limit them explain this state of affairs only partially. The thing truly responsible seems rather to be indigenous temperament.
[47] In the course of the amorous games to which couples give themselves over so willingly and so publicly, and which are often very far advanced, we have never been able to note the beginning of an erection. The pleasure looked for seems to be less of the physical order
833 than playful and sentimental. Sexual relations usually take place at night, and often not far from the fires of the camp. More often the couple draws back about a hundred meters into the neighboring bush. This departure is noted immediately, and gives rise to the most

833 lively jubilation. Comments are exchanged, jokes made, and even the young children share in the excitement whose motive they are well acquainted with. Sometimes even a small group of men, young women and children, take off in pursuit of the couple and watch the details of the operation through the branches, whispering among themselves and muffling their laughter. The principal actors do not appreciate these goings on at all. However, it is better to take part in them as well as to suffer the taunts and mockeries which greet their return to camp. It also happens that a second couple follows the example of the first and seeks, in their turn, the solitude of the bush. The Indians know and use two positions for coitus. We were not able to find out if they are practiced indiscriminately or if the choice depends on a rule. Whatever the case, besides the posterior position (toãtelosu, a1; inkɔlékenore, b1—to copulate from the rear) so frequent in South America, another position (uataʔãdige, b1) can be described as follows: the woman on her back, the man facing her, the right leg only between the legs of the woman and the left leg outside, so that the two superimposed bodies give the general form of an X.

[66] PARENTS AND CHILDREN

593 163 847 The Nambikwara have few children. Couples without children are not rare, one or two children seem to be a normal number, and it is exceptional to find more than three in a household. Sexual prohibitions and the economic conditions on which they are based which also give rise to abortions, explain this situation. Apparently also Nambikwara formerly had the custom of beating to death the children whose mothers died during childbirth. According to the informants, this practice has been abandoned today.

853 855 The mother gives the breast lying on her side with the child pressed against her. These feedings have no fixed time. The child nurses when he wishes and as much as he wishes. Weaning takes place towards the end of the first year, but up to the age of two or three the infant returns from time to time to the maternal breast.

[514] When a child eliminates at the camp site or inside the hut, the father or mother carefully buries the excrement by digging a small hole which is quickly filled with dry sand. A great deal of care is taken to prevent the children from soiling the camp site and the objects placed near them:

619 which cause sickness, they have given the magical herbs whose smoke blinds the dangerous *anánes*, and the techniques which will drive away the storms. Thus the shaman operating on a symbolic level continues the struggle for survival which has been defined for the Nambicuara by the nature of their adjustment to their physical environment and their relationships to one another.

THE LIFE CYCLE

BIRTH

833 The Nambicuara recognize sexual intercourse
[842] (*wisrúenditsu*) as the cause of pregnancy (*halá-jitsu*). This act takes place in the woods while the husband and wife are out hunting or collecting, for it is considered improper to have sexual intercourse in public, even at night around the common camp fire. If a shaman should see a couple in
756 sexual embrace while practicing his rites it would
833 spoil his power. Although shamans use a special hut when calling their *anánes* there is always a chance that they may see a couple in the sexual act, so every effort must be made to avoid this
[834] danger. Shamans themselves abstain from sexual intercourse for 2 or 3 days before getting in contact with the spirits.

843 There appear to be no food taboos surrounding pregnancy among the Wakítsu. The husband continues hunting and collecting as usual, but he must avoid working too hard in the field for
[847] fear of causing his wife to abort. Women do not practice abortion, and the Nambicuara did not mention any medicines used for this purpose.
[832] Honey is considered conducive to sexual vigor and
[842 is used by young couples. Childless marriages
584 are attributed to sterility in women, and a man may abandon his wife for this reason.

844 Birth takes place in the house, or in the camp if the family is out hunting. Just before expecting
[824] the birth of a child the expectant mother drinks the juice of certain herbs which are believed to facilitate birth. The husband and two older women assist in the delivery. The woman kneels on the ground and is supported by her husband. The umbilical cord is tied with a certain vine and then cut with a bamboo sliver. Among the Kitánrhu it is bitten off by one of the midwives. The placenta is buried at the place of birth and when the umbilical cord dries and falls off, it, too,

[p. 102 (8)]

844 is buried in the camp. The child is bathed, and tiny washers made of tucum nut hull are placed [304] on its ear lobes. The washer or ring is cut on an angle so that the two points eventually press through the lobe creating a hole. As the child grows, new washers are added. After a few weeks [551] the child is given a beaded necklace, but it is not named, being known only as the child of so-and-so until puberty, when it receives a name. The Wakítisu appear to have no avoidances following the birth of a child, although the Kitánrhu are [845] said to practice a modified form of couvade. Twins are accepted with satisfaction. Illegitimate [848] children are likewise accepted and are cared for by the girl's parents until she marries. No stigma appears to be attached to an unmarried mother; however, this attitude may be a recent develop- [845] ment. Crippled or malformed babies are not [847] killed, but usually die shortly after birth.

853 Children are nursed until they are 2 or 3 years old or until another child is born. Women in the band assist one another in nursing and taking care of the infants. If a woman should have two small infants, another woman who has lost her 854 child will nurse one of them. Small children are carried on the hip of the mother, sitting on a strap which passes over the opposite shoulder of the mother. This strap which is made from embira bark or woven cotton is about 4 inches in width. Women evidently are accustomed to carrying heavy loads, for on many occasions the tiny women were observed carrying not only their child but also a huge burden basket full of fire-wood. When the child gets a few teeth it begins to chew on a piece of broiled meat. One morning while Kaoro and I were debating what to do with a rat which we had caught in a box trap the night before, neither of us having the courage to put our hand in the box, one of the missionaries suggested we give it to the Nambicuara. Kaoro then carried the box over to Julio's camp and gave it to one of his wives. Without any hesitation 853 the woman put her hand in the box, pulled out 252 the rat, banged its head on the box, and threw it on the coals of her fire. After the hair had been partially singed off she pulled it out, cut off its tail with her thumb nail, and gave it to her cowife's baby, who began sucking on it as if it had been a piece of candy. Then with her thumb

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

114 In questions of relationship they never use the word *ete* (true) since they call their
171 father's brothers "father," their brothers' sons "son," and their father's brothers' sons "brother"; when they wish to designate their actual father or son, they say *xeruba xemonhangara* "my father who engendered me," or, for a son, *xeraira xeremimonhanga* "my son whom I engendered." I never heard an Indian call his wife *xeremireco ete*, but simply *xeremireco* or *xeracig* "mother of my children," and I never heard a woman refer to her husband as *xemenete* "real husband," but simply *xemena* or *xemembira ruba* "father of my children." They use these terms indifferently for their husband or lover. If the husband calls one of his wives *xeremireco ete*, he means the most esteemed or best loved wife and she is often the last one he took.[2]

This text also shows that the Tupi encountered a difficulty in their kinship system, namely, how to distinguish the classificatory parents or children from the consanguineous ones. This stresses the structural similarity between their kinship system and that of the Nambikuara, since the latter met with the same problem. Apparently the Tupi, like the Nambikuara, felt no need for special terms, but when it was necessary, made comments based on physiological considerations. When the Nambikuara are asked to point out the real status
851 of their consanguineous children, they add to the name for "son" or "daugh-
842 ter" another word, the meaning of which is "child" or "little one." The physiological implication of this new term is perfectly clear, since is is ordinarily used to designate newly born animals, while the former terms are applied only to relationships within the human family. Complementary indications regarding the assimilation of the father's brother to a classificatory father may be found in Soares de Sousa.[3]

114 The old authors give numerous examples of cross cousin marriage and of
171 marriages between uncles and nieces. Here again Anchieta will be our main source:

> Though many Indians have several nieces, and very attractive indeed, nevertheless they do not use them as wives. However, brothers have such authority over sisters that they consider their nieces as belonging to them and that they are entitled to marry them and to use them ad libitum if they wish. In the same way they give their sisters to some and refuse them to others. Taragoaj, an important chief of the village of Jaribiatiba in the plain of San Vicente, had two wives one of whom was his niece, his sister's daughter.[4]

Both types of marriage are treated as symmetrical institutions in the same document: " . . . because the fathers give them the daughters and the brothers the sisters. . . ."[5] Furthermore, cross cousin marriage is referred to by Staden:

---

[3] *Roteiro do Brasil* (Revista do Instituto Historico e Geographico Brasileiro, T. 14, 1851), pp. 316-317.

[4] *Loc. cit.*, p. 259. [5] *Ibid.*, p. 261.

542 treated with great affection. The men are jealous of their wives, and
[837] the women take pride in being faithful. In this respect they are quite unlike their neighbors, the Paressi women...

832 The couples are always petting each other, and no caress seems
302 sweeter and more tender to the lover than the woman's fingers running through his hair. This is easy to understand, for the Nambicuara head swarms with vermin...

[Fig. 38]

585 According to reports of the soldier Gouveia, marriage is a simple ceremony. The man asks the father of his beloved for consent to the union. If the father agrees, he gives the bridegroom a bow and a sheaf of arrows, telling him that with these weapons he must support the family he is about to form. That is all.

851 To show that a boy is the son of a certain man, they use in
201 their innocence an expressive gesture: they join the thumb and index finger of the left hand, in the shape of a ring, around the right extended index finger. Then they tap the child and father on the shoulder, saying "Uétü!" (son).

888 They show great respect for old people and spare them all possible effort. When we returned from the village on the Urutau to the post on the Juina, they had us carry [258] on the bow of our saddles the baskets of two old men from the group that accompanied us in search of gifts. The young men and the women all carried their own atiçú and did not ask for help.

771 As to their religion, we know only that it is fetishistic. We know nothing of its cult or system, and even less of its dogma. [Fig. 33]

821 The northern groups seem to be tending toward astrolatry. Once
[771] when I had threatened the moon and the stars with an arrow, poised ready on a strung bow, several Tagnani rose abruptly and halted my gesture, speaking very excitedly, scolding me, and taking the weapon away from me as if it were a sacrilege.

The Cocozu and Anunze threaten the storm with their weapons, waving their arms in all directions and cursing the rain in loud yells.

Sometimes, instead, the women climb on a termite nest where they let out puffs of smoke and throw ashes into the air to frighten the storm.

764 We do not know anything as yet about their funeral rites. It has been ascertained, however, that they do not cremate their dead and do not eat them. They bury them directly [259] in the ground--
the Cocoza in circular pits, the Tagnani in elongated graves.

833 lively jubilation. Comments are exchanged, jokes made, and even the young children share in the excitement whose motive they are well acquainted with. Sometimes even a small group of men, young women and children, take off in pursuit of the couple and watch the details of the operation through the branches, whispering among themselves and muffling their laughter. The principal actors do not appreciate these goings on at all. However, it is better to take part in them as well as to suffer the taunts and mockeries which greet their return to camp. It also happens that a second couple follows the example of the first and seeks, in their turn, the solitude of the bush. The Indians know and use two positions for coitus. We were not able to find out if they are practiced indiscriminately or if the choice depends on a rule. Whatever the case, besides the posterior position (toãtelosu, a1; inkɔlékenore, b1—to copulate from the rear) so frequent in South America, another position (uataʔãdige, b1) can be described as follows: the woman on her back, the man facing her, the right leg only between the legs of the woman and the left leg outside, so that the two superimposed bodies give the general form of an X.

[66] PARENTS AND CHILDREN

593 163 847 The Nambikwara have few children. Couples without children are not rare, one or two children seem to be a normal number, and it is exceptional to find more than three in a household. Sexual prohibitions and the economic conditions on which they are based which also give rise to abortions, explain this situation. Apparently also Nambikwara formerly had the custom of beating to death the children whose mothers died during childbirth. According to the informants, this practice has been abandoned today.

853 855 The mother gives the breast lying on her side with the child pressed against her. These feedings have no fixed time. The child nurses when he wishes and as much as he wishes. Weaning takes place towards the end of the first year, but up to the age of two or three the infant returns from time to time to the maternal breast.

[514] When a child eliminates at the camp site or inside the hut, the father or mother carefully buries the excrement by digging a small hole which is quickly filled with dry sand. A great deal of care is taken to prevent the children from soiling the camp site and the objects placed near them:

844 is buried in the camp. The child is bathed, and tiny washers made of tucum nut hull are placed [304] on its ear lobes. The washer or ring is cut on an angle so that the two points eventually press through the lobe creating a hole. As the child grows, new washers are added. After a few weeks [551] the child is given a beaded necklace, but it is not named, being known only as the child of so-and-so until puberty, when it receives a name. The Wakítisu appear to have no avoidances following the birth of a child, although the Kitânrhu are [845] said to practice a modified form of couvade. Twins are accepted with satisfaction. Illegitimate [848] children are likewise accepted and are cared for by the girl's parents until she marries. No stigma appears to be attached to an unmarried mother; however, this attitude may be a recent development. Crippled or malformed babies are not [845] [847] killed, but usually die shortly after birth.

● 853 Children are nursed until they are 2 or 3 years old or until another child is born. Women in the band assist one another in nursing and taking care of the infants. If a woman should have two small infants, another woman who has lost her 854 child will nurse one of them. Small children are carried on the hip of the mother, sitting on a strap which passes over the opposite shoulder of the mother. This strap which is made from embira bark or woven cotton is about 4 inches in width. Women evidently are accustomed to carrying heavy loads, for on many occasions the tiny women were observed carrying not only their child but also a huge burden basket full of firewood. When the child gets a few teeth it begins to chew on a piece of broiled meat. One morning while Kaoro and I were debating what to do with a rat which we had caught in a box trap the night before, neither of us having the courage to put our hand in the box, one of the missionaries suggested we give it to the Nambicuara. Kaoro then carried the box over to Julio's camp and gave 853 it to one of his wives. Without any hesitation 252 the woman put her hand in the box, pulled out the rat, banged its head on the box, and threw it on the coals of her fire. After the hair had been partially singed off she pulled it out, cut off its tail with her thumb nail, and gave it to her cowife's baby, who began sucking on it as if it had been a piece of candy. Then with her thumb

853 nail she opened the rat and threw the viscera and
252 the rat on the coals. Within 15 minutes that rat was eaten, entrails and all, while Kaoro and I looked on in a state of horrified fascination.
[262] Children thus begin by eating broiled meat and fish; pieces of sour, gritty manioc cake are given to them at a more advanced age.

PUBERTY

881 When a boy reaches the age of 14 or 15 he has
[304] his upper lip and the septum of his nose pierced with a sharpened fibula of a monkey ("macaco-prego"). One man holds the boy's arms, another his head, while an older male relative performs the piercing. Small plugs of bamboo are then placed in the holes. The following night the shaman leads the band in singing and dancing. Food is prepared in large quantities and offerings are made to the ghosts who are believed to be present
[553] at the ceremony. The boy is now given a name which he will keep throughout his life. If the boy's father is dead he will use his father's name. If the father is alive he will use the name of some dead member in his grandfather's generation. In this way names are passed from one generation to another. An important part of the boy's puberty ceremony is the ritual beating administered by the old men of the band. He is now permitted to take part in the singing and can be present when the sacred flutes are played in the flute hut. Although this creates an attitude of obedience to the older men, he still continues to be abusive toward the women of the band. His unmarried female cross cousins now begin to notice him and openly show their desire to go hunting with him.

The puberty ceremony for girls is much more elaborate. After a girl has her first menses her father builds a small hut in the center of the camp, in which the girl is secluded. She must remain in this hut day and night and is attended by her
[202] female relatives. The chief then calls all members of the band together, even sending messengers to distant hunting parties. When the band is united the chief organizes a hunt in which all the men take part, and they must remain away from the
[251] camp until the moon is full. While on the hunt they accumulate a great quantity of smoked meat. When the moon is full, the men send a messenger to the camp to whom the women give some of the

752 They spread saliva on bâanêcedûtû sores with the palm of the hand. They squeeze insect bites between two fingers.

757 Those suffering from fever go quietly into a corner, when they do not leap into running water. They eat nothing as long as the seizure lasts.

In the village on the Juina River there was an old Indian of about sixty. He was sad and prostrate and was not cheered by our gifts. He would put his hands to his head to show that it was aching. A lad who seemed [251] to be his son judging by the extreme affection he bestowed on the old man, contrary to the other Indians, kept offering him honey with water. Each time the old man would turn away. In the afternoon, his condition not having improved, he called the boy and said something to him.

The lad grasped the man's head in his hands and put his mouth against the nostrils, sucking hard. It seems that this suction which he repeated later was helpful, for the old man became more expansive.

[Fig. 41]

853 Childbirth must be easy, considering how poorly the foetus is nourished. The Indian women, when they do not have sufficient milk, take a drought of water in their mouth and put their lips onto those of the baby, transferring the liquid in a nourishing kiss.

844 I wanted to know how they cut the umbilical cord and showed several Indians who were more outgoing and intelligent--Damasceno, Nuleke, Krikriceknerá--a drawing in a book that showed a foetus with its attachments. From Damasceno's replies I understood that the mother cuts the cord with her teeth and hides the placenta under some leaves.

This piece of information obviously remains subject to revision.

531 Drawings by the Indians of the Serra do Norte, though rudimentary, reveal some interesting motifs emancipated from animal forms.

The circle, triangle and square are drawn in black on the surface of some gourds.

[532] [252] Snakes and saurians are sometimes drawn sketchily(1)

113 1. See E. Roquette-Pinto, "Documentos para o estudo da psicologia dos Indios do

855 and he is left alone a whole day. When evening comes, however,
157 his mother cares for him tenderly, removes lice from him while he sleeps, signals to others not to approach, and makes for him a sort of cradle in her arms.

●854 A young mother, c21, plays with her baby giving him little slaps
157 on the back. The baby begins to laugh, and she gets excited by the game to such an extent that she hits him harder and harder, so that he cries. Then she stops and consoles him.

736 We saw the little orphan girl a9, whom everyone loves, literally trampled during a dance. She had fallen in the general excitement
858 of the celebration without anyone paying any attention. On the other hand, when they are opposed, children readily strike their
865 mother, and the latter does not fight back. Children are never
861 punished, and we have never seen one of them spanked, nor even the
853 gesture made, except as a joke. Sometimes, a child cries (1) because
515

1. The tears of a child are not called by the same name as those shed ritually by adults in the course of mourning. In the first case: to weep, nãsere, nãdige; in the second: to weep, doriãgeʒere (b1).

he has hurt himself, was in a fight, or is hungry,

10. ũftsotnaniena narũdnerajena indõtenajena ĩnẽere (b1) the child cries, he is thirsty, he is hungry, he wishes to eat,

or because he does not want to be deloused. But this last case is rare, for delousing seems to charm the patient as much as it amuses the operator. It is also held to be a mark of interest and affection. When he wishes to be deloused, the child—or the husband—places his head on the woman's knees, presenting the two sides of his head in succession. The operator proceeds by parting hair or looking through the strands. The louse that is caught is immediately crushed. The child who cries is quickly consoled by [68] a member of his family or by an older child. In general, they have little to com-
[861] plain about. Very pampered, rarely scolded, never whipped, they live free, useless and lazy.

854 Also, the sight of the mother and her child is usually full of gaiety and freshness. The mother holds an object out to the baby through the straw of the shelter and withdraws it at the moment the baby thinks he has it:

●854 11. kalajodné daẽ joʔdnoherẽ (b1)
Take it from the front! Take it from the back!

Or else, amidst great bursts of laughter, she takes the child and pretends to be going to throw him to the ground:

12. ãmdam nõm tebũ nihiɰi (b1)
(The mother) "I am going to throw you!" (the child) "I don't want to!"

855 593 Reciprocally, the children surround their mother with a tenderness that is demanding and sometimes unquieting. At the time of leaving group b1, we jokingly proposed to a little girl (b5) that we take her with us. Her response was very characteristic, and at the same time similar to that which many other children would have made under the same circumstances:

13. hõdnjẽ odengenãhjen ĵuadaʔjen tamãhnãdaje. (b1)
No! I don't want to go! I am afraid! Mama would cry!

And another observation also makes evident the affection which is always present on the part of the child: a father (C20) brings wild honey and begins by giving some to his son (C22), and only then to his wife (c21); the child, worried, watches his father's movements to see if his mother will receive her share.

[842] 855 593 During the period which precedes weaning, the child lives in as great intimacy with his father as his mother. Like the latter, the father takes care of him, holds him in his arms, wipes up his excrement when necessary, etc. Later, the child lives closer to his mother. She carries him on trips till he can walk, and later he walks at her side. He remains with her at camp or village while his father goes hunting. However, the proprieties of relationships depend first of all on the sex of the child. A father shows more interest in his son than in his daughter, since he must teach him the masculine techniques and occupations: and the same thing is true concerning relationships of a mother and daughter. But as a whole, the relationships of the father with his children show the same [843] tenderness and solicitude that we have previously mentioned. The father plays with his child while carrying him on his shoulder (alakuiriginare, b1). He makes weapons to fit the size of the child's little arms:

14. mĩ'nde tanirẽtnore ikõlãagetire (b1)
The father makes arrows for the child.

736 [69] Concerning a young male orphan, nearly an adolescent, it was said to us one day that "he does not go hunting because he has no father to make him a bow." In certain cases, the father must extend his care and, to a certain degree, substitute for the absent

854 From this time on, the life of the Nambikwara infant goes on as we have described, and without there being much differentiation according to sex. These differences begin to appear only at the ap-
881 proach of puberty. At this time, the girls adopt a completely new behavior. They allow themselves great liberties, speaking brutally to their entourage and [109] amusing themselves with obscene acts. The fact is that the ceremony of puberty, which coincides with mar-
[553] riage, marks a decided change in her life and it is also upon that occasion that she receives her name. The Nambikwara women marry
582 very soon after their first menstruation. The polygamy of the chiefs
[595] creates a permanent deficit of women, and the newly available wife is impatiently awaited. According to our informants, it is the young
584 girl who indicates to her parents which of her potential husbands she wishes to marry. She says that she "wishes to marry quickly" (ikĩ'ndurige, bl); the term of dialect a1 for "to marry" being oyensaikititu, literally: "to make a husband," it seems that, as has been affirmed, the initiative belongs to the girl:

48. inka (ni) durednjẽn durenje (bl)
"I wish to marry quickly" [says the girl]. "Marry," says the mother] (?)

Actually, it seems that the marriage is decided from infancy by an agreement between the parents. Farseeing parents must prepare far in advance the marriage of their son, for otherwise the latter risks not finding an available woman. Brothers-in-law have often indicated to us that their children were promised to one another.

881 At the time of puberty, the young girl is completely isolated for a period of from two to four months. She lives in a specially constructed shelter some distance from the village, and lives there alone, observing a series of alimentary and social taboos. During this period, her mother feeds her and takes care of her. The period of segration ended, songs and dances take place. Her shelter is torn down and "the mother takes back her child." Then the ceremony proper of marriage takes place. It is prepared by hunting and fishing, expeditions and is carried out amidst chants and dances:

49. ʃirige aĵũngnerage denano inĵira ʃikira ʃiknira tãʃta halonoo tatiĩkta ʃindage hntimbata uĩrige imãgora imãgora (bl)
Go get fish, the women arrive, arrive, to broil [the fish] in the square go out, sing, whistle, play the flute, play the flute.

SP17 Nambicuara SP17

and dots hanging down from the nape of the neck. A similar but shorter headdress may be worn in daily life.

Hair is groomed with a composite comb. It is cut with a shell, either all around the head at the level of the ear lobe, or only across the forehead, the back and sides being allowed to fall loose. Body painting consists mainly of urucú smeared uniformly, but some groups roughly trace black dots and stripes with genipa juice on the chest and legs. Face and body hair is generally pulled out, especially by women; men often have a sparse moustache and beard.

TRANSPORTATION

Canoes are unknown. Small waterways are crossed on a fallen tree; large ones by swimming, sometimes with the help of large floating bundles of buriti palm stems. Babies straddle their mother's hip supported by a large sling of bark or woven cotton.

MANUFACTURES

Spinning.—Women spin cotton with a crude drop spindle made of grass stalk. The whorl is a wild fruit, a potsherd, or a conical piece of sun-dried clay. Cotton thread is rolled in a ball and, like everything else in a *Nambicuara* household, wrapped in leaves. Women and men twist tucum and buriti fibers on their thighs to make string.

Weaving.—Weaving is limited to cotton bands and belts which men make on small, rough looms of the "*Arawak*" type (pl. 37, *center, right*).

Basketry.—Men make long, open-mouthed, cylindrical baskets using bamboo strips and a hexagonal, open weave. Fire fans are plaited of palm leaves. The *Northern Nambicuara* used palm leaves to weave low square baskets for storing the manioc and maize flour.

Pottery.—Pottery is unknown among the *Eastern Nambicuara*. In other groups, women make coarse pots of varying sizes. They mix the clay with ashes, fire the pot in the open, and wash it while it is still hot in an infusion of resinous bark.

Implements.—Stone ax heads were formerly fixed with wax and strings in the loop of a bent handle. Knives and drills are made of a crude flint chip or piece of iron fastened with wax and thread at the end of a piece of wood or between two pieces of wood, which form the handle. Women hollow small cylindrical mortars in tree trunks by means of fire. Fire is made with a fire drill, crude rubber serving as tinder. The Indians burn almecega (*Tetragastris balsamifera*) resin for light. Knives are thin, sharp-edged pieces of wood.

Weapons.—The *Nambicuara* bow is about 5 to 7 feet (2 m.) long, the section being flat, semicircular, or concave according to the group. The grip is wrapped with cotton. The arrow is released between the thumb and the first finger, the three other fingers being placed on the

The Wakl'tisu do not
323 make pottery, but they sometimes acquire pots from the Paressi in exchange for game or fish.

HUNTING, FISHING, AND COLLECTING

621 Today, at least, the Wakl'tisu band is a producing and consuming unit. Whatever a man or his family gathers is shared among the band. This, however, does not mean that the whole band goes out every day or that they keep together while out hunting, fishing, and collecting. Except
594 when the men go hunting such large game as the jaguar, tapir, and peccary, the acquisitive unit is the family. Every morning while Julio's band was camped in Utiarity a family or two could be seen going out, the husband walking in front armed with bow and arrows, the wife following
[482 and carrying a burden basket on her back and a
● 854] baby strapped on her hip, an older child following her. As they move slowly along they collect
222 fruits, nuts, insects, snakes, ants, lizards, rats, wild honey, and a great variety of grubs or larvae.
226 When they come to a pond they wade around with small baskets in their hands and scoop out small fish. On one of these trips I observed them
[252 catching fish that were only 2 inches in length.
262] These were later thrown on hot coals and eaten without being cleaned. Small birds no larger
223 than a sparrow are shot if the man can get near
222 enough to use his bow and arrow. If they come
[314] to a buriti stalk of the right size they will cut it down, put it into the burden basket, and take it
313 to camp. On their way home they will usually pick up dry firewood. Thus, when a family returns at nightfall the basket will be full of a wide assortment of foods and useful materials.

224 Monkeys, deer, and large birds are generally
[177] stalked by a single hunter, particularly if he has a gun. Julio and Marciano each owned a shotgun and quite often hunted alone. If a man goes out in the morning and runs onto a group of peccaries he will hurry back to camp, and all the men will then go to where the peccaries are feeding. When they hear the peccaries the hunters will form into three files, one heading directly toward the pigs, the other two flanking the game on each side. When near enough the middle file stops and spreads out, the other two files then slowly surround the pigs. As the flanking movement is going on the pigs sometimes move, but the middle group of hunters maintains contact

844 is buried in the camp. The child is bathed, and tiny washers made of tucum nut hull are placed [304] on its ear lobes. The washer or ring is cut on an angle so that the two points eventually press through the lobe creating a hole. As the child grows, new washers are added. After a few weeks [551] the child is given a beaded necklace, but it is not named, being known only as the child of so-and-so until puberty, when it receives a name. The Wakĺítisu appear to have no avoidances following the birth of a child, although the Kitánrhu are [845] said to practice a modified form of couvade. Twins are accepted with satisfaction. Illegitimate [848] children are likewise accepted and are cared for by the girl's parents until she marries. No stigma appears to be attached to an unmarried mother; however, this attitude may be a recent develop- [845] ment. Crippled or malformed babies are not [847] killed, but usually die shortly after birth.

853 Children are nursed until they are 2 or 3 years old or until another child is born. Women in the band assist one another in nursing and taking care of the infants. If a woman should have two small infants, another wŏman who has lost her ●854 child will nurse one of them. Small children are carried on the hip of the mother, sitting on a strap which passes over the opposite shoulder of the mother. This strap which is made from embira bark or woven cotton is about 4 inches in width. Women evidently are accustomed to carrying heavy loads, for on many occasions the tiny women were observed carrying not only their child but also a huge burden basket full of fire-wood. When the child gets a few teeth it begins to chew on a piece of broiled meat. One morning while Kaoro and I were debating what to do with a rat which we had caught in a box trap the night before, neither of us having the courage to put our hand in the box, one of the missionaries suggested we give it to the Nambicuara. Kaoro then carried the box over to Julio's camp and gave 853 it to one of his wives. Without any hesitation 252 the woman put her hand in the box, pulled out the rat, banged its head on the box, and threw it on the coals of her fire. After the hair had been partially singed off she pulled it out, cut off its tail with her thumb nail, and gave it to her cowife's baby, who began sucking on it as if it had been a piece of candy. Then with her thumb

Nambicuara children

854 Children are treated with great affection and refused nothing. They are rarely punished. Many an Indian, already elderly would walk for leagues [256] with a child on his back to come to us and give the little one some of the presents we were distributing.

622 They have no clearly defined chiefs. Some men the muleteers call chiefs are merely individuals of some influence frequently heeded by the others.

578 622 One day, in Campos Novos, we were visited by the Cocozu and Anunze. Several young men of both groups spent the night there: Nuleke, Krikriceknerá (Manduca), Paixão, Preguiça [Port. "sloth], Damasceno, and the famous Cavagnac, supposed chief of the Urutau village, a scoundrel who used to ambush the muleteers on the Line and take their packs.

On the following day many Uaintaçu came; they were bold, rough, and quite unpleasant people.

The others, when they saw the Uiantaçu approaching, gave signs of agitation. Finally the Uaintaçu arrived, very much excited by the presence of our guests. An endless discussion ensued among the three groups. They all talked and gesticulated in angry fashion, with gleaming eyes, ready to attack each other. Fearing a conflict which would be disastrous on every count, we intervened by distributing cigarettes, matches, axes, etc., in order to distract them. They calmed down. But some of the Cocozu and Uaintaçu boys continued to argue and were gradually surrounded by the others who listened attentively. Two on one side would speak; two from the other side would reply. The two Indians who talked, Damasceno and Cavagnac, were more intelligent, clever and bold. There was nothing to indicate that they were true chiefs, recognized as such on every occasion. They were temporary chiefs.

622 Among the Tagnani and Tawite, on the other hand, there are clearly defined secular chiefs. One of them stood out because he wore no ornaments whatever [257]. He actually commanded and was obeyed by all. He had three wives.

562 The status of the Nambicuara woman is not so degraded as that of other Brazilian Indian women. She works hard, it is true, She [462] gathers fruit, grates manioc, handles the mortar and pestle, erects the hunting shelters, spins cotton, carries the family belongings, cares for the children, takes part in cultivating the plot; but usually she is

512 [516] on the ground in the position known by the name "aztec"—on their knees, the legs and feet flat on their inner side and the buttocks resting on the heels. Or else they cut, polish and file beads from nut- [306] [515] shells or sea shells, earrings or other ornaments. And if the work bores them, they pick the lice from one another, stroll around or sleep.

512 521 During the warmest hours the camp is silent. The inhabitants, silent or asleep, enjoy the uncertain shade of the shelters. The rest of the time, the occupations are carried on with animated conversations. Nearly always gay and laughing, the Indians exchange jokes, and sometimes, with unmistakable gestures, obscene or scatological accounts which are greeted with great shouts of laughter. The work is often interrupted by mutual visits or questions; when two dogs or birds copulate, everybody stops and contemplates the operation with fascinated interest; then work is taken up again, after an exchange of commentaries about this important happening.

512 The children lounge around during a great part of the day, the girls surrendering themselves at times to the same jobs as their elders, the boys idle or fishing along a stream of water. The men remaining in camp dedicate themselves to basketwork, making arrows and musical instruments, and sometimes to performing some small domestic service. Complete accord usually reigns within the household. Toward three or four o'clock, the other men return from the hunt, the camp becomes animated, the conversation becomes livelier, groups form, different from family agglomerations. They eat yucca cakes [262] and everything found during the day: fish, roots, wild honey, bats, 824 little animals captured, and small sweet nuts from the palm bacaiuva (Acrocomia sp.). Sometimes a child begins to cry, quickly [856] consoled by an elder. When night falls some women, chosen daily, go to collect or cut down in the neighboring woods the store of wood 512 for the [17] night. They can be seen returning in the twilight, 313 staggering under the load which pulls the tumpline used for carrying 482 it. To unload, they crouch and lean backwards a little, letting their bundle of bamboo rest on the ground in order to disengage the tumpline from their forehead.

512 In a corner of the camp the branches are amassed and each one supplies himself in proportion to his needs. The family groups form around their respective fires which begin to glow. The evening is passed in conversation, or else in singing and dancing. Sometimes these distractions are prolonged far into the night, but in general, after some amusements of caressing and friendly fighting, the couples draw closer together, the mothers clutch their sleeping infants to them, everything becomes silent, and the cold night is

115 a7. --A pretty woman of some twenty years, perhaps less; young
157 wife of A6. Her parents are living and reside, she says, in the village. She is asintu of A1 and a2, arindesu of a3 and a4, aseetasu of a5. She is stupid, egotistical, interested only in herself. She considers herself very seductive, which appears to be (from the Indian point of view, of course) very exaggerated. She systematically refuses to show the slightest interest in the two daughters of her husband, conducts herself very amorously as concerns him.

115 a8 and a9--About six and two years, daughters of the first mar-
●855 riage of A6 and daughters of the deceased daughter of a14. The two
157 children are practically left to themselves. Their stepmother does not bother with them; their father takes care of them when his manly tasks and his wife permit him the time. Their grandmother is their
[603] chief aid and it is to her that they run when they hurt themselves, are hungry, thirsty or afraid. But she herself is absorbed by the cares of her sons, of her stepson (A15) and of her husband. And very often the baby is neglected for entire days, covered with ashes and filth, unless some woman of the group, seized by pity or simply [43] disgusted, takes her and gives her a bath. Most often it is her big sister, precociously mature, who takes care of her, carries her, even though she is scarcely any bigger, feeds her and cleans her up. Both are charming children, gay and hungry for caresses like those who are habitually deprived of them. Their lot is a great worry for the
[181] community. Under this regime of a hard life constantly absorbed by the small tasks, each one of which is hard work, one can with difficulty accept other cares than one's own. And these neglected children are a perpetual source of irritation, of which they are often the victims, even when taken care of. Many times we wondered if we should not take charge of the youngest of the children. They would have given her to us gladly. The baby was so cute that we would have been tempted if the perspective of seeing ourselves having a quarrel on the return trip with the Service for the Protection of the Indians had not, very reasonably, dissuaded us.

115 A10. --About 40 years. He is alonsu of A1, ajunkedisu of a2,
157 ahuinosu of a5, married to a11. His parents are dead. He is amiable and grinning, he suffers from a hernia which he hides under a piece of cloth hanging from his waist. His activity is considerably decreased. He is little interested in our work and not very eager to understand our questions and give us information.

a11. --About 40 years. Wife of A10. She is a "sister" of a2, a "wife" of A1, a "mother" of a5. She is dark, eager and industrious,

833 lively jubilation. Comments are exchanged, jokes made, and even the young children share in the excitement whose motive they are well acquainted with. Sometimes even a small group of men, young women and children, take off in pursuit of the couple and watch the details of the operation through the branches, whispering among themselves and muffling their laughter. The principal actors do not appreciate these goings on at all. However, it is better to take part in them as well as to suffer the taunts and mockeries which greet their return to camp. It also happens that a second couple follows the example of the first and seeks, in their turn, the solitude of the bush. The Indians know and use two positions for coitus. We were not able to find out if they are practiced indiscriminately or if the choice depends on a rule. Whatever the case, besides the posterior position (toãtelosu, a1; inkalékenote, b1—to copulate from the rear) so frequent in South America, another position (uatalãdige, b1) can be described as follows: the woman on her back, the man facing her, the right leg only between the legs of the woman and the left leg outside, so that the two superimposed bodies give the general form of an X.

[66] PARENTS AND CHILDREN

593 163 847 The Nambikwara have few children. Couples without children are not rare, one or two children seem to be a normal number, and it is exceptional to find more than three in a household. Sexual prohibitions and the economic conditions on which they are based which also give rise to abortions, explain this situation. Apparently also Nambikwara formerly had the custom of beating to death the children whose mothers died during childbirth. According to the informants, this practice has been abandoned today.

853 855 The mother gives the breast lying on her side with the child pressed against her. These feedings have no fixed time. The child nurses when he wishes and as much as he wishes. Weaning takes place towards the end of the first year, but up to the age of two or three the infant returns from time to time to the maternal breast.

[514] When a child eliminates at the camp site or inside the hut, the father or mother carefully buries the excrement by digging a small hole which is quickly filled with dry sand. A great deal of care is taken to prevent the children from soiling the camp site and the objects placed near them.

855 863 8. ụ̈erisekihĩndage numĩ sekolaiene elamnihĩ (b1)
The child has urinated! the hide! he is dirty! throw out(the urine)!

Later, when the child can isolate himself but not yet clean himself up, he is seen returning on all fours to his mother and remaining in that position while she applies the small twig in the way that has been previously described.

142 856 All children seem to have a pigmented blotch at birth to which no particular belief is attached. The informants only mention the phenomenon with that positive and detached attitude so striking on their part:

9. ụ̈ĩtte ʂ̂edeʂ̂edednege tõodayige ka ka ka ụ̈dérige (b1)
the children marked with green are born, one day, one day, one day, it disappears.

The disappearance of the blotch actually seems to be very rapid.

593 602 609 One should, naturally, distinguish true parentage and classificatory parentage. The child does not adopt any particular form of conduct towards his "fathers" and "mothers" in the classificatory sense of the word. He treats them like other adults of the group. Often, furthermore, an individual calls a boy or girl much younger than himself father or mother (thus a19 and a20 are "mothers" of A6 and A24).

[597] [601] When an orphan is taken in by a parallel uncle or aunt, the classificatory parents take the place of true parents, and consequently the conduct changes. In general, the Indians do not use [67] a term to distinguish classificatory parents and children from blood ones. When seeking precision, they add the word tauẽttu (a1), tauẽtte (b1): "my little one," to the term for son or daughter (a?kiraru, a?kineru), whose connotation seems thus to be social first of all. The physiological acceptance of this springs from the fact that the word is also used to designate the young of animals, other terms being reserved for relationships of parentage in the human family.

855 157 The Nambikwara feel very real affection for their children, and show it as regards them, and they are repaid in turn. But these sentiments, however real and profound they may be, are often masked behind the nervousness and instability so characteristic of indigenous conduct. Also, as the following example will show, the risk is to let oneself be fooled by apparent indifference, and even momentary rudeness.

Little A16 suffers from indigestion; he has a headache, vomits, passes half the time groaning and the other half sleeping. He is ill, (intikãtu, a1), but no one, parents included, pays the least attention,

855 and he is left alone a whole day. When evening comes, however,
157 his mother cares for him tenderly, removes lice from him while he sleeps, signals to others not to approach, and makes for him a sort of cradle in her arms.

854 A young mother, c21, plays with her baby giving him little slaps
157 on the back. The baby begins to laugh, and she gets excited by the game to such an extent that she hits him harder and harder, so that he cries. Then she stops and consoles him.

736 We saw the little orphan girl a9, whom everyone loves, literally trampled during a dance. She had fallen in the general excitement
858 of the celebration without anyone paying any attention. On the other hand, when they are opposed, children readily strike their
865 mother, and the latter does not fight back. Children are never
861 punished, and we have never seen one of them spanked, nor even the
855 gesture made, except as a joke. Sometimes, a child cries (1) because
515

1. The tears of a child are not called by the same name as those shed ritually by adults in the course of mourning. In the first case: to weep, nãṣere, nãdige; in the second: to weep, doriãgeṣere (b1).

he has hurt himself, was in a fight, or is hungry,

10. ụ̃ṭsotnaniena narũdnerajena indõtenajena ũnʔeere (b1) the child cries, he is thirsty, he is hungry, he wishes to eat,

or because he does not want to be deloused. But this last case is rare, for delousing seems to charm the patient as much as it amuses the operator. It is also held to be a mark of interest and affection. When he wishes to be deloused, the child—or the husband--places his head on the woman's knees, presenting the two sides of his head in succession. The operator proceeds by parting hair or looking through the strands. The louse that is caught is immediately crushed. The child who cries is quickly consoled by [68] a member of his family or by an older child. In general, they have little to com-
[861] plain about. Very pampered, rarely scolded, never whipped, they live free, useless and lazy.

854 Also, the sight of the mother and her child is usually full of gaiety and freshness. The mother holds an object out to the baby through the straw of the shelter and withdraws it at the moment the baby thinks he has it:

854 11. kalaɻodnẽ daẽ ɻoʔdnoherẽ (b1)
Take it from the front! Take it from the back!

Or else, amidst great bursts of laughter, she takes the child and pretends to be going to throw him to the ground:

12. ãmdam nõm tebũ nihiɲi (b1)
(The mother) "I am going to throw you!" (the child) "I don't want to!"

855 Reciprocally, the children surround their mother with a tenderness
593 that is demanding and sometimes unquieting. At the time of leaving group b1, we jokingly proposed to a little girl (b5) that we take her with us. Her response was very characteristic, and at the same time similar to that which many other children would have made under the same circumstances:

13. hõdnjẽ odengenãhjen ɻuadaʔjen tamãhnãdaɻe. (b1)
No! I don't want to go! I am afraid! Mama would cry!

And another observation also makes evident the affection which is always present on the part of the child: a father (C20) brings wild honey and begins by giving some to his son (C22), and only then to his wife (c21); the child, worried, watches his father's movements to see if his mother will receive her share.

[862] During the period which precedes weaning, the child lives in as
855 great intimacy with his father as his mother. Like the latter, the
593 father takes care of him, holds him in his arms, wipes up his excrement when necessary, etc. Later, the child lives closer to his mother. She carries him on trips till he can walk, and later he walks at her side. He remains with her at camp or village while his father goes hunting. However, the proprieties of relationships depend first of all on the sex of the child. A father shows more interest in his son than in his daughter, since he must teach him the masculine techniques and occupations: and the same thing is true concerning relationships of a mother and daughter. But as a whole, the relationships of the father with his children show the same
[843] tenderness and solicitude that we have previously mentioned. The father plays with his child while carrying him on his shoulder (alakuiriginare, b1). He makes weapons to fit the size of the child's little arms:

14. mifnde tauirẽtnore ikɔlãagetire (b1)
The father makes arrows for the child.

736 [69] Concerning a young male orphan, nearly an adolescent, it was said to us one day that "he does not go hunting because he has no father to make him a bow." In certain cases, the father must extend his care and, to a certain degree, substitute for the absent

The shaman of group c (C20) plays with one of his two wives (c21).

824 It is a curious fact that palm cabbage (palmito) is not utilized by the Serra do Norte Indians. Gabriel Soares [234] made it clear in 1587 that the aborigines of the coast prized the leaf buds of the palm tree: "Stupendous palm cabbages, five or six spans in length and as thick as a man's leg, are extracted from the buds of these palms."

273 Pineapple wine was a common beverage, for Soares goes on to say: "The nature of this fruit is hot and humid, and it is very harmful [278] to those with open wounds or sores; the same pineapples, when green [757] are good for curing sores, for their juice eats away all the rotten and putrid flesh, and the aborigines know this; in such wise does this fruit [296] eat away, that they use its rind to wipe off the rust from their swords and knives and to remove the stains from the clothes they wash; when ripe, the juice is used by the Indians to make a wine which inebriates them; to this end they pluck the fruit not quite ripe, on account of its being more sour..."

263 The Indians of the Serra do Norte found our salted food unpleasant. They often refused the plates we set before them, giving us to understand that it was the salty flavor which led them to behave in this manner.

262 Milk (condensed milk) was also rejected in the beginning; they would make a face and say that it was human milk and therefore repulsive: [235] "Anungçú!"

261 One must know the Indians' gluttony, their insatiable hunger, their continual, unfailing, artless, persistent animus devorandi, fully to comprehend the disgust which led them to such a renunciation.

262 The children are given to eat of everything; no matter what 855 goes into an Indian's mouth, there is always a crumb for the little one who walks beside him or rests in his arms.

276 Even the stimulants they use--tobacco, for instance--are shared 855 with the children. More than once I had the opportunity to observe Indians giving cigarettes to children under two. (1)

[113]

000
[411] [245] The Tagnani also use a kind of fish trap.

A rare type of blunt arrow is designed for the capture of birds
223 which serve as playmates to Nambicuara children.

The birds are felled by the impact and caught easily. Some
231 become used to their cruel captivity; a woodpecker (Colaptes
[825] campestris, Vieil) was occasionally imprisoned by a boy under a gourd. No sooner did the child remove the cup than the bird, instead of flying away, would perch upon him. It is true that the Indian nourishes his domesticated birds very well: he constantly feeds them from his own mouth, gently gorging them.

[Fig. 59]

To our intense surprise, as the cephalic measurements of an Anunze woman were being taken, a baby rat fell from the nape of her neck where it had apparently been living cozily, hiding in her hair as in the grass where it was born.

[825] Doves (Chamepelius talpacoti), young vultures (Sarcoramphus papa, Catharista atrastus brasiliensis, Bonap), monkeys and small owls are also domesticated in the Serra do Norte.

Before the days of the Rondon Commission, the Nambicuara were not familiar with the ox, the mule or the dog. They are still afraid of the ox because of its horns; they have a liking for the donkey, whose meat they find similar to that of the tapir.

[246] They are now good friends of the dog, which at first frightened them greatly; they steal a few whenever they can, and these dogs quickly take a fancy to [the Indians] because they are so well fed. In the master's eating gourd there is always room for the dog's muzzle.

● 855 They carry their children in a strap slung over the shoulder and across the chest, which the Cocozu make with straw and the others with cotton.

484 They take along everything they own on the shortest excursions; this is a nomadic habit surviving among a nearly sedentary people.

241 A population as large as that of the Serra do Norte would be unable to subsist exclusively on hunting and fishing. The Indians would be forced to travel far and wide in search of food; they would have been annihilated long ago, or else deprived of those characteristics which only their isolation could maintain.

372 They make fire with mastic resin sticks, the tips of which are wrapped in straw to protect them from the rain.

[Fig. 63]

241 415 Their plots are worked with pointed sticks. The seeds of urucu, gourd plants (Lagenaria) and cotton are kept in leaf containers.

278 824 Medicinal fruit (Solanum mammosum) is also saved, as well as roots, leaves, etc.

[Fig. 31]

386 The collection contains two samples of dyes: a paste of urucu and fat, sweetly scented, which the women use to paint their body after the bath (huduhukaidi); and a variety of red ocher. [279]

248 Cotton (1) is represented by seeds (rim de boi variety) in leaf

[171]

1. According to the studies of Fa. Schmidt and Nordenskjöld (concerning hammocks), cotton reached Brazil from the Andes and was cultivated mostly by the Tupian Indians in the midst of the Amazon jungle. It is used less extensively among the Arawakan Indians. This distribution, due in part to the needs of the plant, explains its presence among the Nambicuara, who are located at the extreme west of the plateau. (R. L.)

[283 286] containers; cotton thread (kondzú) from a spindle (gdaretatú); skeins [855] of spun cotton; cotton fabric (sareguêzê--strap used to carry children). [283] The spindle is made of a palm splinter imbedded in a round potsherd.

[Fig. 64]

415 924 Kateçú are fruits of the Lagenaria genus used as containers and storage vessels. Some hold crudely chopped tobacco and are stoppled with a corn cob, a method frequently used by the frontiersmen.

[See fig. ... (28) p. 30B.]

nights" kanaroʔetẽndige (b1); inversely, nights without moon are particularly approved, as well as rainy periods. In 1938 the rains were late, and the first showers came in September after six months of total drought. The event, so long awaited, was immediately celebrated by B1, who did not even wait for night to have sexual relations with his youngest wife b2. However, day-time relations are rare, and the act was carried out more ostensibly than usual, behind the thin palms of a shelter. Immediately afterwards B1 supplied a spontaneous commentary on meteorological prohibitions. Sexual relations are also, at least theoretically, forbidden between husband and wife [65] from the birth of the child to the time when he can walk. This event is hurried along by rubbing his legs with the juice of a non-identified plant (tourʔiri, c) "so that he will walk quickly, so that another can be made" (1); but, by "another," is understood, undoubtedly sexual intercourse rather than their result, rarely welcome: the Nambikwara women often have recourse to abortion, and they are familiar with a great number of plants and roots for that use. We were not able to obtain a specimen.

1. The same custom existed among the ancient Tupi. Cf. Cardim, Tratado da terra et da gente do Brasil, new ed., Rio-de-Janeiro, 1925, p. 170.

The attitude of the Nambikwara toward things pertaining to love can be summed up in their formula tamĩndige mõndage, translated literally, if not elegantly: "To make love is good." We have already mentioned the erotic atmosphere which fills daily life. Love affairs hold the interest and curiosity of the Indians to the highest degree. They are eager for conversation on these subjects, and the remarks exchanged in the camp are filled with allusions and hidden meanings. However, sexual relations are rare, and the prohibitions which limit them explain this state of affairs only partially. The thing truly responsible seems rather to be indigenous temperament. In the course of the amorous games to which couples give themselves over so willingly and so publicly, and which are often very far advanced, we have never been able to note the beginning of an erection. The pleasure looked for seems to be less of the physical order than playful and sentimental. Sexual relations usually take place at night, and often not far from the fires of the camp. More often the couple draws back about a hundred meters into the neighboring bush. This departure is noted immediately, and gives rise to the most

855 8. nɛ̃rɨsekihĩndage numĩ sekɔlajene ɛlamnihĩ (bl)
863 The child has urinated! the hide! he is dirty! throw out(the urine)!

Later, when the child can isolate himself but not yet clean himself up, he is seen returning on all fours to his mother and remaining in that position while she applies the small twig in the way that has been previously described.

142 All children seem to have a pigmented blotch at birth to which
856 no particular belief is attached. The informants only mention the phenomenon with that positive and detached attitude so striking on their part:

9. nĩtte ʒedeʒedednege tɔodayige ka ka ka uuderige (bl)
the children marked with green are born, one day, one day, one day, it disappears.

The disappearance of the blotch actually seems to be very rapid.

593 One should, naturally, distinguish true parentage and classificatory
602 parentage. The child does not adopt any particular form of conduct
609 towards his "fathers" and "mothers" in the classificatory sense of the word. He treats them like other adults of the group. Often, furthermore, an individual calls a boy or girl much younger than himself father or mother (thus a19 and a20 are "mothers" of A6 and A24).
[597] When an orphan is taken in by a parallel uncle or aunt, the classificatory parents take the place of true parents, and consequently the
[601] conduct changes. In general, the Indians do not use [67] a term to distinguish classificatory parents and children from blood ones. When seeking precision, they add the word tayɛ̃ttu (a1), tayɛ̃tte (b1): "my little one," to the term for son or daughter (aʔkiraru, aʔkineru), whose connotation seems thus to be social first of all. The physiological acceptance of this springs from the fact that the word is also used to designate the young of animals, other terms being reserved for relationships of parentage in the human family.

855 The Nambikwara feel very real affection for their children, and
157 show it as regards them, and they are repaid in turn. But these sentiments, however real and profound they may be, are often masked behind the nervousness and instability so characteristic of indigenous conduct. Also, as the following example will show, the risk is to let oneself be fooled by apparent indifference, and even momentary rudeness.

Little A16 suffers from indigestion; he has a headache, vomits, passes half the time groaning and the other half sleeping. He is ill, (intikatu, a1), but no one, parents included, pays the least attention,

595
571 piece of small animal. a5 asks for part of it and a4 answers:
"Let your father give you his." These relationships bring about
856 a rather curious consequence: the young girls become independ-
595 ent more rapidly than the boys. They follow the young wives,
take part in their activities, while the boys, left to themselves,
timidly try to adapt themselves to the group but without great
success, and usually remain, at least in earliest childhood, be-
side their mothers.

857 [70] Considering now the relationships of children among
themselves, the most striking characteristic is the absence of
play. In certain groups (central and south), the children
manufacture, although rarely, small objects of rolled or braided
straw, but generally they know no other distraction than fights
or contests which they do together, and lead an existence
modeled on that of the adults. In fact, they carry on the normal
day of the women: in the morning, preparing the manioc, then
the cumaru nuts, bathing when it begins to get warm; when the
sun is very high, retiring to the shade, and before night, gather-
ing wood for the fire. Likewise, the girls learn to weave, they
walk around, laugh, sleep. The little boys do not begin to
play with little bows and imitate the male pursuits until much
later (from 8 to 10 years on). But all become rapidly conscious
of the fundamental and sometimes tragic problem of Nambikwara
life, that of nourishment, and of the active role that is expected
of them. They take part in the harvesting and collecting ex-
peditions with great excitement. In time of need, it is not rare
to see them seek their own food outside the camp, working to
unearth roots, or walking in the grass on tiptoe, a large stripped
branch in hand, to catch grasshoppers. The little girls know
what an important role the women have in the economic life of
the tribe, and are impatient to make themselves worthy of it.
[231 Thus, we find a young girl (b5) who tenderly carries a puppy
482] in the tump line that her mother uses for her little sister, and
we make the remark:

16. uainuftte nfkorage
She caresses the little puppy?

Her mother answers me:

nefkuatmore uainuetuikode?ena tãitniene
The little girl caresses the puppy (because she wishes) to
raise it.

to which the little girl adds gravely:

595
571 piece of small animal. a5 asks for part of it and a4 answers:
"Let your father give you his." These relationships bring about
856 a rather curious consequence: the young girls become independ-
595 ent more rapidly than the boys. They follow the young wives,
take part in their activities, while the boys, left to themselves,
timidly try to adapt themselves to the group but without great
success, and usually remain, at least in earliest childhood, be-
side their mothers.

857 [70] Considering now the relationships of children among
themselves, the most striking characteristic is the absence of
play. In certain groups (central and south), the children
manufacture, although rarely, small objects of rolled or braided
straw, but generally they know no other distraction than fights
or contests which they do together, and lead an existence
modeled on that of the adults. In fact, they carry on the normal
day of the women: in the morning, preparing the manioc, then
the cumaru nuts, bathing when it begins to get warm; when the
sun is very high, retiring to the shade, and before night, gather-
ing wood for the fire. Likewise, the girls learn to weave, they
walk around, laugh, sleep. The little boys do not begin to
play with little bows and imitate the male pursuits until much
later (from 8 to 10 years on). But all become rapidly conscious
of the fundamental and sometimes tragic problem of Nambikwara
life, that of nourishment, and of the active role that is expected
of them. They take part in the harvesting and collecting ex-
peditions with great excitement. In time of need, it is not rare
to see them seek their own food outside the camp, working to
unearth roots, or walking in the grass on tiptoe, a large stripped
branch in hand, to catch grasshoppers. The little girls know
what an important role the women have in the economic life of
the tribe, and are impatient to make themselves worthy of it.
[231 Thus, we find a young girl (b5) who tenderly carries a puppy
482] in the tump line that her mother uses for her little sister, and
we make the remark:

16. uainuttte ufkɔrage
She caresses the little puppy?

Her mother answers me:

uefkuatnore uainuetuikɔdeʔena tãitniene
The little girl caresses the puppy (because she wishes) to
raise it.

to which the little girl adds gravely:

857 iõndage ŝutẽnturu kajãno kajãn kajãn hõte kajãnde ŝutentere kuajkano (b1).

When I am big, I shall catch the caetetu, caetetu, caetetu, the monkey, the caetetus, I shall kill them when it (the dog) barks.

[868] She makes an error in grammar which the father points out
857 laughingly: she should have said tilõdage, "when I am big,"
154 instead of the masculine form she used. The error is interesting, placed in context, which manifestly shows a feminine desire to raise the economic activities reserved for that sex to the level of those which are the men's privilege. As the exact sense of ŝutẽntere is "to kill by beating with a stick or club" (here, the digging stick), the informant tries unconsciously to identify [71] feminine collecting and gathering (which can only aim at the capture of small animals) with the masculine hunt, armed with bow and arrows.

593 The relationships between brothers and sisters have not given rise to any particular observation. In the central and southern group, one finds a special expression to designate the brother of the same sex, nlaõre, "the other one"; this term is not only applied to kinship relationships, but also designates objects be-
[342] longing to the same type. Thus the five or six poles planted obliquely which fan out from the center, and which hold up the first skeleton of the hut, are called indeleaore; likewise, the
[534] double (kalõde) or triple (lutəndione) pipes or whistles. Friendly
857 groups are said to be "brothers" (1) also, and in discussions

1. See p. 92.

between adversaries they use the exclamation:

17. kakõtiane takənaãtiane (b1).

Wicked one! You are no longer my brother!

[192] which indicates that among the Nambikwara the term "brother" has the same wide sense which it possesses in our vocabulary.
857 But in the heart of the infantile society, numerous attitudes take
182 form which prepare or advance later relationships. The orphan baby a9 spends nearly the whole day in the hands of her young sister a8 (one is 2 to 3 years old, the other 6 to 7). Her sister takes care of her, carries her, feeds her. a19 and a20 (who are "mothers") act like elders toward these two children, in a way more marked than the real difference in age calls for. In fact, a8 and a20 are contemporaries. The eldest, a19, cracks bacaiuva

857 182 nuts for her sister a20 and eats them with her. When they are satisfied, they give the rest to a8, who cracks them, in turn, for her little sister.

857 The relationships between children giving each other the names husband and wife are more obscure, and we have not succeeded in forming a clear concept of them. We have pointed out a slight taboo exists concerning the expression of this kinship relationship. However, generally, the young "husbands" or "wives" do not manifest any special behavior toward one another, either positive or negative. Nevertheless, we have encountered indisputable cases where the young potential spouses conduct themselves as true spouses. In the evening they leave the family fire and carry burning pieces of wood to light their fire in a corner of the camp. The witnesses pay scarcely any attention to this action. For example, someone will make the remark:

18. uftnauri ufraire tiaahete ufrajena noreteuii etlftere (b1). The children are taking fire to make a fire, they blow to make flames.

[72] and the young "husband" says to his potential wife:

19. tadoõtakui nikuitũterani etʔere aituruui uatadahaki (b1) Bend down! Stir the fire, carry! Look (for more). Put it there!

857 After this, they install themselves near their fire and give 864 themselves over, insofar as it is within their means, to all the erotic acts that they have seen their elders practice. The incident is greeted by the adults with indifference, or, at the most, with amused smiles: uetnó taminusere, "there are the children having little sexual relations," they say in passing. We have only verified these practices in a haphazard way among the young children (5 to 7 years). They seem to be absent among those nearer puberty, but, in the latter case, a lacuna appears in our observations, due to the lack of subjects for comparison.

857 As regards strangers, the attitude of children is quite variable. 609 Certain ones manifest fear and hostility for a long time:

20. tauette ʔiina jaʔirina unjena (b1)
My child is frightened, he is ashamed, he doesn't move.

sometimes explained by a surprising external detail:

herakaloui ĩĩrena (b1)
he is afraid of glasses.

Others (or the same ones after several days or weeks of acclimatization) are curious, friendly, eventually mystifying. Thus,

857 609 b5, who insists that the treatment that one gives the small animal to divest it of its hair be applied to the ethnologist:

21. nʔiuɣenãghẽẽ nʔuɣẽeguedne (b1)
Put his beard in the fire! Roast his beard!

857 157 In general, they are to be good companions, enthusiastic, and untiringly avid for games that are shown them. In exchange, they are very obliging informants once they have become friends. [551] Almost all the information which we were able to gather concerning proper names comes from them.[1]

231 This chapter cannot be ended without presenting some observations relating to domestic animals. Not only do the children actually live in very intimate relationships with the animals, but the latter are treated in the family like real children at least outwardly. We mean that they share the group's food, benefit from the same manifestations of tenderness or interest—delousing, games, conversation, caresses—as the human beings. In everything, their treatment is [73] curiously the same. The Nambikwara have numerous domestic animals, first of all dogs, and cocks and hens, who are all descendants of those introduced in their region by the Rondon Commission; monkeys, parakeets, birds of various kinds, and finally, the caetetu, the coati (Nasua sp.), the jaguatirica. Only the dog seems to have acquired an [224] occasionally utilitarian role in the service of women, for hunting with the digging stick (cf. quotation No. 16). The men never use them for hunting with bow and arrow. The other animals are raised for the purpose of pleasure. They are not eaten, 231 262 the people do not consume the eggs of the hens who lay them in the bush. But they do not hesitate to devour a young bird if it dies after a vain attempt at acclimatization.

The terms used for behavior regarding animals are the same as those used for humans. They say dehẽna uɾtte uɾkɔrage, "the woman caresses the baby," or uãinuẽtte uɾkɔrage, "the woman caresses the puppy."

231 While traveling, except for the animals capable of walking, 482 the whole menagerie is packed with the other baggage. The monkeys, attached to the women's hair, adorn them with an amusing living helmet, elongated by the long tail curled around the neck of the bearer. The parakeets and hens perch on top of the baskets, other animals are held in the arms. None of them receive abundant nourishment but, even in days of need, they 231 521 have their share, however little it may be. As compensation, they are an endless subject of distraction for the group, the

[1] [ie. From the children.--Analyst]

231 principal spectacle for amusement. One hears such exclama-
521 tions as:

22. jakhũninde ɾteru ɥirokũnene (b1)
The flying ants! He (the monkey) catches them to eat!

They talk to the monkey while giving him fruits: ɥosɾ, "take!" and as the monkeys live very intimately with the dogs, they laugh hilariously seeing their goings on:

23. hõte ɥãinde miramiraina hõte ɥairɾdniena (b1).
The monkey mounts the back of the dog! The monkey bites the dog!

and again:

24. kuɣarisena tãkɸlahẽ tãkela ãyorisẽ kãdaiena (b1).
It is balancing head down, head down it balances, it fell! (the monkey).

231 The children like to play at burning animals, and when
857 insects are involved, they are allowed to do so; but if they try
[865] to burn domestic animals by touching them surreptitiously with a piece of smoldering wood, they are severely reprimanded.

[74] THE GRANDPARENTS

603 We use the term in the classificatory sense, that is, the members of the third ascendant generation. In general, there are few—two in restricted group a1, five out of 75 persons in the enlarged group, three out of 31 in enlarged group b1 (in this estimate we do not include A1, a2 and a14, who can be classed as grandparents indirectly). This small number is
[165 explained, in part, by the very high mortality rate of the
887] Nambikwara, and partially also by the fact that aged persons, although participating in the nomadic life, do not move with the same mobility as the other members of the group, and are met more rarely. Whatever the case may be, the grandparents share the life of their descendants. The founding of a new family does not erase the ties between adults and their parents. We have underlined several examples while studying the phenomena
[592] of residence. Aged or widowed parents join the household of their son or daughter, either permanently or temporarily. Thus, in the absence of his son-in-law (A21) and of his wife (a18), A17 installs himself with his daughter (a22) and her baby (a23). She is the one who cooks manioc and cumaru nuts for the three.

601 The Indians do not seem to perceive
602 the specific nature of certain inter-individual relationships except in
[593] the case of relationships of stepmother and stepfather, as will be seen farther on. Nevertheless, the very great liberty which reigns between a man and his wife on one hand, and his brothers-in-law on the other, contrasts greatly with the more serious and dull character of his dealings with his sisters or his (theoretical) wives. This reserve goes to the point of forbidding the verbal expression of the relationship of potential spouses among the children to a certain degree. In the
[124] course of our interrogations, we have always found it difficult to obtain an answer from the interested parties themselves or from their close relatives when the relationship was that of husband and wife (1).

1. The Indian questioned answers that he "does not know" or changes the subject of conversation.

However, there was no case where the exact answer was not given after several evasive words, or an affectation of ignorance, or an attitude of ill will. But however slight the prohibition (the exact information seems to be considered rather as an impropriety or an
[858] indelicacy), it is no less odd because of it, since children classed as potential spouses behave often, and very openly, as such, without anyone objecting to it.

595 Several times we have alluded to polygamy, concrete examples
462 of which were analyzed on the occasion of the study of the kinship systems. Among the Nambikwara, polygamy represents a general tendency limited by the quantity of available women, and a prerogative existing among the chiefs of the groups, the shamans, or outstanding personalities. From this point of view, it springs from the study of command, and we shall return to this when this problem is tackled. Whenever it exists, polygamy is not a substitute for monogamous marriage, it is added to it without suppressing it. An individual begins by marrying one single woman, and upon the occasion of his social advancement, or of happy occasions, it is suitable for him to add some companions. But a very clear distinction, even though it is not sanctioned by the vocabulary of kinship (2), is

595
601 2. To characterize the functions of the first wife, an informant (A6) once used the term asiesu a?ouerelisu (a1); to designate the supplementary wives, another informant (B1) mentioned a form nuk̊nañtere, which could be a feminine of nuk̊nañore (b1), "companion," a term which the chief uses to designate the men of his group. But the

855 and he is left alone a whole day. When evening comes, however,
157 his mother cares for him tenderly, removes lice from him while he sleeps, signals to others not to approach, and makes for him a sort of cradle in her arms.

854 A young mother, c21, plays with her baby giving him little slaps
157 on the back. The baby begins to laugh, and she gets excited by the game to such an extent that she hits him harder and harder, so that he cries. Then she stops and consoles him.

736 We saw the little orphan girl a9, whom everyone loves, literally trampled during a dance. She had fallen in the general excitement
● 858 of the celebration without anyone paying any attention. On the other hand, when they are opposed, children readily strike their
865 mother, and the latter does not fight back. Children are never
861 punished, and we have never seen one of them spanked, nor even the
855 gesture made, except as a joke. Sometimes, a child cries (1) because
515

1. The tears of a child are not called by the same name as those shed ritually by adults in the course of mourning. In the first case: to weep, nãṣere, nãdige; in the second: to weep, doriãgeṣere (b1).

he has hurt himself, was in a fight, or is hungry,

10. ụ̃tsotnaniena narõdnerajena indõtenajena ũ̃ʔeere (b1) the child cries, he is thirsty, he is hungry, he wishes to eat,

or because he does not want to be deloused. But this last case is rare, for delousing seems to charm the patient as much as it amuses the operator. It is also held to be a mark of interest and affection. When he wishes to be deloused, the child--or the husband--places his head on the woman's knees, presenting the two sides of his head in succession. The operator proceeds by parting hair or looking through the strands. The louse that is caught is immediately crushed. The child who cries is quickly consoled by [68] a member of his family or by an older child. In general, they have little to com-
[861] plain about. Very pampered, rarely scolded, never whipped, they live free, useless and lazy.

854 Also, the sight of the mother and her child is usually full of gaiety and freshness. The mother holds an object out to the baby through the straw of the shelter and withdraws it at the moment the baby thinks he has it:

855 and he is left alone a whole day. When evening comes, however,
157 his mother cares for him tenderly, removes lice from him while he sleeps, signals to others not to approach, and makes for him a sort of cradle in her arms.

he has hurt himself, was in a fight, or is hungry,

10. uftsotnaniena naṟũdnerajena indõtenajena ũnʔeere (b1) the child cries, he is thirsty, he is hungry, he wishes to eat,

or because he does not want to be deloused. But this last case is rare, for delousing seems to charm the patient as much as it amuses the operator. It is also held to be a mark of interest and affection. When he wishes to be deloused, the child--or the husband--places his head on the woman's knees, presenting the two sides of his head in succession. The operator proceeds by parting hair or looking through the strands. The louse that is caught is immediately crushed. The child who cries is quickly consoled by [68] a member of his family or by an older child. In general, they have little to com-
[861] plain about. Very pampered, rarely scolded, never whipped, they live free, useless and lazy.

854 Also, the sight of the mother and her child is usually full of gaiety and freshness. The mother holds an object out to the baby through the straw of the shelter and withdraws it at the moment the baby thinks he has it:

854 11. kalaɻodnẽ daẽ ɻoʔdnoherẽ (b1)
Take it from the front! Take it from the back!

Or else, amidst great bursts of laughter, she takes the child and pretends to be going to throw him to the ground:

12. ãmdam nõm tebũ nihiɻi (b1)
(The mother) "I am going to throw you!" (the child) "I don't want to!"

855 593 Reciprocally, the children surround their mother with a tenderness that is demanding and sometimes unquieting. At the time of leaving group b1, we jokingly proposed to a little girl (b5) that we take her with us. Her response was very characteristic, and at the same time similar to that which many other children would have made under the same circumstances:

13. hõdnjẽ odengenãhien ŝuadaʔien tanãhnãdaje. (b1)
No! I don't want to go! I am afraid! Mama would cry!

And another observation also makes evident the affection which is always present on the part of the child: a father (C20) brings wild honey and begins by giving some to his son (C22), and only then to his wife (c21); the child, worried, watches his father's movements to see if his mother will receive her share.

● [862] 855 593 During the period which precedes weaning, the child lives in as great intimacy with his father as his mother. Like the latter, the father takes care of him, holds him in his arms, wipes up his excrement when necessary, etc. Later, the child lives closer to his mother. She carries him on trips till he can walk, and later he walks at her side. He remains with her at camp or village while his father goes hunting. However, the proprieties of relationships depend first of all on the sex of the child. A father shows more interest in his son than in his daughter, since he must teach him the masculine techniques and occupations: and the same thing is true concerning relationships of a mother and daughter. But as a whole, the relationships of the father with his children show the same [843] tenderness and solicitude that we have previously mentioned. The father plays with his child while carrying him on his shoulder (alakuiriginare, b1). He makes weapons to fit the size of the child's little arms:

14. mĩnde tauirẽtnore ikõlãagetire (b1)
The father makes arrows for the child.

736 [69] Concerning a young male orphan, nearly an adolescent, it was said to us one day that "he does not go hunting because he has no father to make him a bow." In certain cases, the father must extend his care and, to a certain degree, substitute for the absent

846 252 them between herself and the baby. For the first time, she exchanges some words with her neighbors while laughing.

846 252 224 In the meantime, A21 has cleaned the irara. He gives the stomach, the large intestine, the small intestine to a2 (wife's sister); she, aided by her daughter a5, cleans the intestines, puts them on to cook and begins to eat them with a5 and a3.

A21 cuts the tail of the irara, cooks it rapidly, and eats it with his wife and baby.

The three bats have been given to a2 (wife's sister) and a14 (sister), who divides her lot with her son A16 and her son-in-law A15. a22 cooks the lizards and the organs (liver, heart, lungs, spleen, kidneys of the irara). She gives the whole thing to her husband, who gives a piece of liver to the baby and divides the rest with his wife.

All of these operations are carried out very rapidly in a sort of hurry, and are finished at the end of a half-hour. At 30 minutes past 15 o'clock, a22 lights a different fire from the one that each household uses, and places the irara there. She then goes to take her first bath in the river, and brings back some water in a gourd to wash the baby. Toward 16:15 the cooked irara is taken from the fire by A21. At this moment everyone has returned to camp and has taken his habitual place. A21 and a22, seated near the new fire, occupy a central position. A21 cuts the irara into five pieces and divides it among the members of the family, as was said previously. (1)

1. Cf. above, p. 74 f.

From that time on, A21 and a22 take up normal activity and are no longer distinguished from their companions.

846 Thus the period of abstinence is characterized by relative isolation of the couple in question, which is at the same time under a certain number of taboos (social contacts, baths, preparation of food, dress, eating of certain foods). It ends at the moment when the child takes its first meal not consisting solely of milk (in this [224 case the lizard eggs and the irara liver. This meal is part of a hunting ● 862] feast offered to the group by the parents who up to now were under the taboo. However, the atmosphere in which these operations are carried out merits attention. No solemnity surrounds them, and the parties concerned perform them with the same routine and nonchalance which characterizes daily activities. It is not a question then of a ceremony with the psychological implications which this term carries, but of a collection of acts which must be done, and are done, with a minimum of attention accorded to their exceptional character.

853 nail she opened the rat and threw the viscera and
252 the rat on the coals. Within 15 minutes that rat was eaten, entrails and all, while Kaoro and I looked on in a state of horrified fascination.
[262] Children thus begin by eating broiled meat and fish; pieces of sour, gritty manioc cake are given to them at a more advanced age.

PUBERTY

881 When a boy reaches the age of 14 or 15 he has
[304] his upper lip and the septum of his nose pierced with a sharpened fibula of a monkey ("macaco-prego"). One man holds the boy's arms, another his head, while an older male relative performs the piercing. Small plugs of bamboo are then placed in the holes. The following night the shaman leads the band in singing and dancing. Food is prepared in large quantities and offerings are made to the ghosts who are believed to be present
[553] at the ceremony. The boy is now given a name which he will keep throughout his life. If the boy's father is dead he will use his father's name. If the father is alive he will use the name of some dead member in his grandfather's generation. In this way names are passed from one generation to another. An important part of the boy's puberty ceremony is the ritual beating administered by the old men of the band. He is now permitted to take part in the singing and can be present when the sacred flutes are played in the flute hut. Although this creates an attitude of obedience to the older men, he still continues to be abusive toward the women of the band. His unmarried female cross cousins now begin to notice him and openly show their desire to go hunting with him.

The puberty ceremony for girls is much more elaborate. After a girl has her first menses her father builds a small hut in the center of the camp, in which the girl is secluded. She must remain in this hut day and night and is attended by her
[202] female relatives. The chief then calls all members of the band together, even sending messengers to distant hunting parties. When the band is united the chief organizes a hunt in which all the men take part, and they must remain away from the
[251] camp until the moon is full. While on the hunt they accumulate a great quantity of smoked meat. When the moon is full, the men send a messenger to the camp to whom the women give some of the

855 8. nerisekihĩndage numĩ sekəlajene ẽlamnihĩ (b1)
863 The child has urinated! the hide! he is dirty! throw out(the urine)!

Later, when the child can isolate himself but not yet clean himself up, he is seen returning on all fours to his mother and remaining in that position while she applies the small twig in the way that has been previously described.

142 All children seem to have a pigmented blotch at birth to which
856 no particular belief is attached. The informants only mention the phenomenon with that positive and detached attitude so striking on their part:

9. ũ'tte ʒedeʒedednege tõodaʏige ka ka ka ũderige (b1)
the children marked with green are born, one day, one day, one day, it disappears.

The disappearance of the blotch actually seems to be very rapid.

593 One should, naturally, distinguish true parentage and classificatory
602 parentage. The child does not adopt any particular form of conduct
609 towards his "fathers" and "mothers" in the classificatory sense of the word. He treats them like other adults of the group. Often, furthermore, an individual calls a boy or girl much younger than himself father or mother (thus a19 and a20 are "mothers" of A6 and A24).
[597] When an orphan is taken in by a parallel uncle or aunt, the classificatory parents take the place of true parents, and consequently the
[601] conduct changes. In general, the Indians do not use [67] a term to distinguish classificatory parents and children from blood ones. When seeking precision, they add the word tayettu (a1), tayette (b1): "my little one," to the term for son or daughter (a?kiraru, a?kineru), whose connotation seems thus to be social first of all. The physiological acceptance of this springs from the fact that the word is also used to designate the young of animals, other terms being reserved for relationships of parentage in the human family.

855 The Nambikwara feel very real affection for their children, and
157 show it as regards them, and they are repaid in turn. But these sentiments, however real and profound they may be, are often masked behind the nervousness and instability so characteristic of indigenous conduct. Also, as the following example will show, the risk is to let oneself be fooled by apparent indifference, and even momentary rudeness.

Little A16 suffers from indigestion; he has a headache, vomits, passes half the time groaning and the other half sleeping. He is ill, (intikatu, a1), but no one, parents included, pays the least attention,

857 nuts for her sister a2Q and eats them with her. When they are
182 satisfied, they give the rest to a♀ who cracks them in turn
for her little sister.

857 The relationships between children giving each other the names husband and wife are more obscure, and we have not succeeded in forming a clear concept of them. We have pointed out a slight taboo exists concerning the expression of this kinship relationship. However, generally, the young "husbands" or "wives" do not manifest any special behavior toward one another, either positive or negative. Nevertheless, we have encountered indisputable cases where the young potential spouses conduct themselves as true spouses. In the evening they leave the family fire and carry burning pieces of wood to light their fire in a corner of the camp. The witnesses pay scarcely any attention to this action. For example, someone will make the remark:

18. ɰĩtnaɰi ɰĩraɪre tiɛahete ɰĩraɪena norẽteɰii etĩĩtere (b1).
The children are taking fire to make a fire, they blow to make flames.

[72] and the young "husband" says to his potential wife:

19. tadoõtakɰi nikɰitũteraɰi etɛere aituruɰi ɰatadahaki (b1)
Bend down! Stir the fire, carry! Look (for more). Put it there!

857 After this, they install themselves near their fire and give
● 864 themselves over, insofar as it is within their means, to all the erotic acts that they have seen their elders practice. The incident is greeted by the adults with indifference, or, at the most, with amused smiles: ɰenó taminusere, "there are the children having little sexual relations," they say in passing. We have only verified these practices in a haphazard way among the young children (5 to 7 years). They seem to be absent among those nearer puberty, but, in the latter case, a lacuna appears in our observations, due to the lack of subjects for comparison.

857 As regards strangers, the attitude of children is quite variable.
609 Certain ones manifest fear and hostility for a long time:

20. taɰẽtte ʔĩina jaʔirina unjena (b1)
My child is frightened, he is ashamed, he doesn't move.

sometimes explained by a surprising external detail:

herikaɰi ĩĩrena (b1)
he is afraid of glasses.

Others (or the same ones after several days or weeks of acclimatization) are curious, friendly, eventually mystifying. Thus,

855 and he is left alone a whole day. When evening comes, however,
157 his mother cares for him tenderly, removes lice from him while he sleeps, signals to others not to approach, and makes for him a sort of cradle in her arms.

854 A young mother, c21, plays with her baby giving him little slaps
157 on the back. The baby begins to laugh, and she gets excited by the game to such an extent that she hits him harder and harder, so that he cries. Then she stops and consoles him.

736 We saw the little orphan girl a9, whom everyone loves, literally trampled during a dance. She had fallen in the general excitement
858 of the celebration without anyone paying any attention. On the other hand, when they are opposed, children readily strike their
● 865 mother, and the latter does not fight back. Children are never
861 punished, and we have never seen one of them spanked, nor even the
855 gesture made, except as a joke. Sometimes, a child cries (1) because
515

1. The tears of a child are not called by the same name as those shed ritually by adults in the course of mourning. In the first case: to weep, nãṣere, nãdige; in the second: to weep, doriãgeṣere (b1).

he has hurt himself, was in a fight, or is hungry,

10. ụ̃ṭsotnaniena naṇũdnerajena indõtenajena ũ̃ṇeere (b1)
the child cries, he is thirsty, he is hungry, he wishes to eat,

or because he does not want to be deloused. But this last case is rare, for delousing seems to charm the patient as much as it amuses the operator. It is also held to be a mark of interest and affection. When he wishes to be deloused, the child—or the husband—places his head on the woman's knees, presenting the two sides of his head in succession. The operator proceeds by parting hair or looking through the strands. The louse that is caught is immediately crushed. The child who cries is quickly consoled by [68] a member of his family or by an older child. In general, they have little to com-
[861] plain about. Very pampered, rarely scolded, never whipped, they live free, useless and lazy.

854 Also, the sight of the mother and her child is usually full of gaiety and freshness. The mother holds an object out to the baby through the straw of the shelter and withdraws it at the moment the baby thinks he has it:

231 principal spectacle for amusement. One hears such exclama-
521 tions as:

22. jakhũninde ʃteru ɥirokũnene (b1)
The flying ants! He (the monkey) catches them to eat!

They talk to the monkey while giving him fruits: ɥoʃʃ, "take!" and as the monkeys live very intimately with the dogs, they laugh hilariously seeing their goings on:

23. hõte ɥãinde miramiraĩna hõte ɥairʃdnĩena (b1).
The monkey mounts the back of the dog! The monkey bites the dog!

and again:

24. kuɣarisena tãkɣlahẽ tãkela ãɣorĩsẽ kãdaĩena (b1).
It is balancing head down, head down it balances, it fell! (the monkey).

231 The children like to play at burning animals, and when
857 insects are involved, they are allowed to do so; but if they try
865 to burn domestic animals by touching them surreptitiously with a piece of smoldering wood, they are severely reprimanded.

[74] THE GRANDPARENTS

603 We use the term in the classificatory sense, that is, the members of the third ascendant generation. In general, there are few—two in restricted group a1, five out of 75 persons in the enlarged group, three out of 31 in enlarged group b1 (in this estimate we do not include A1, a2 and a14, who can be classed as grandparents indirectly). This small number is
165 explained, in part, by the very high mortality rate of the
887 Nambikwara, and partially also by the fact that aged persons, although participating in the nomadic life, do not move with the same mobility as the other members of the group, and are met more rarely. Whatever the case may be, the grandparents share the life of their descendants. The founding of a new family does not erase the ties between adults and their parents. We have underlined several examples while studying the phenomena
592 of residence. Aged or widowed parents join the household of their son or daughter, either permanently or temporarily. Thus, in the absence of his son-in-law (A21) and of his wife (a18), A17 installs himself with his daughter (a22) and her baby (a23). She is the one who cooks manioc and cumaru nuts for the three.

857 iõndage ʔutẽnturu kajãno kajãn kajãn hõte kajãnde ʔutentere kuajkano (b1).
When I am big, I shall catch the caetetu, caetetu, caetetu, the monkey, the caetetus, I shall kill them when it (the dog) barks.

●[368] She makes an error in grammar which the father points out
857 laughingly: she should have said tilõdage, "when I am big,"
154 instead of the masculine form she used. The error is interesting, placed in context, which manifestly shows a feminine desire to raise the economic activities reserved for that sex to the level of those which are the men's privilege. As the exact sense of ʔutẽntere is "to kill by beating with a stick or club" (here, the digging stick), the informant tries unconsciously to identify [71] feminine collecting and gathering (which can only aim at the capture of small animals) with the masculine hunt, armed with bow and arrows.

593 The relationships between brothers and sisters have not given rise to any particular observation. In the central and southern group, one finds a special expression to designate the brother of the same sex, nlaõre, "the other one"; this term is not only applied to kinship relationships, but also designates objects be-
[342] longing to the same type. Thus the five or six poles planted obliquely which fan out from the center, and which hold up the first skeleton of the hut, are called indeleaore; likewise, the
[534] double (kalõde) or triple (lutəndione) pipes or whistles. Friendly
857 groups are said to be "brothers" (1) also, and in discussions

1. See p. 92.

between adversaries they use the exclamation:
17. kakõtiane takənaãtiane (b1).
Wicked one! You are no longer my brother!
[192] which indicates that among the Nambikwara the term "brother" has the same wide sense which it possesses in our vocabulary.
857 But in the heart of the infantile society, numerous attitudes take
182 form which prepare or advance later relationships. The orphan baby a9 spends nearly the whole day in the hands of her young sister a8 (one is 2 to 3 years old, the other 6 to 7). Her sister takes care of her, carries her, feeds her. a19 and a20 (who are "mothers") act like elders toward these two children, in a way more marked than the real difference in age calls for. In fact, a8 and a20 are contemporaries. The eldest, a19, cracks bacaiuva

[734] wife. We have already cited the case of the two little girls
593 a8 and a9 whose stepmother (a7) refuses to take care of them.
Their father (A6) must, then, assume many of the lesser func-
[842] tions. At the time of departure for a trip, it is he who prepares
the basket for the elder, measures on her the length of the tump
line, and shortens it thanks to the free end which he fastens
passing it several times through the holes of the basket-work.
●869 It is also the father who tells the children the traditional stories.
538 And, with a view to shortening and making more intelligible
these often long and repetitious accounts, he applies himself
to transposing them in a style especially adapted for children.
Thus, the infant's version of the story of the Flood (1) is as

1. See below, p. 120, the complete version of this story.

follows:

15. ɣáitento dohonenŝiram kánaram hépatnẽ atátene ɣeidenkiathattene ɣaĩndɔnle. (b1)
Everyone was dead! There was no one left! Not a man!
Everyone was dead! Nothing more!

595 Relationships of a particular nature exist in the case of
571 polygamous marriage between the children of the first wife and
their young stepmothers. Even though the latter are called
"mother" or of "sister of the mother" by them, they live in a
state of companionship with them, especially with the girls,
which also extends to all the children of the group. We have
already dwelled on this society of girls and young wives who
take collective baths, go to defecate in a group, smoke to-
gether, joke and give themselves over to rather farfetched games,
such as spitting long jets of saliva in one another's face. An-
other example: a3 and a4 play with their stepdaughter a5. One
of them pushes her and throws her to the ground with such
violence that her head cracks against the ground and the little
one begins to shriek. The two young women heap mockeries
upon her. Finally, the youngest goes to drag her from the
ground almost by force and pushes her toward her mother, with-
out ceremony, like a package. These relationships are close,
appreciated, but without courtesy, like those which young boys
might have in our society. They rarely imply service or atten-
tion. Thus, A1 and his polygamous wives a3 and a4 divide a

551 As seen by the list, two categories of names exist. The adults possess a name of their own. The children are named after their parents—son, or daughter, of so and so. The name used in this case is usually that of the mother (a5/a12 (but who is not a child), A16/a19/a20); but not always: a8 and a9, whose mother is dead, are both called after their father, daughters of Tairiisu. As concerns a23, who is a little baby, a wide divergence manifests itself among our informants (it must not be forgotten that they are children, and that their information is uncertain), and the name of Karlokineru, daughter of Karlolesu, her father, has been taken even though her mother is living. But, as will be seen farther on, during our stay A21, a22, and a23 are confused in the same borderline way. On the other hand, the fact that the names of Kiatorekineru and of Idonerekineru could be chosen for a20 and a22 suggests that they are not the daughters of a18, but parallel cousins of her daughters. If such is not the case, the two names may be part of a collection, or have been attributed wrongly to their supposed holders.

[553 ●881] Adolescents receive their names from the chief at the moment of puberty. The name giving is a point to which we shall return later on. The fact that certain adults are designated on our list by a technical term is undoubtedly explained by the fact that our informants did not know their true names. Nevertheless, it must be noticed that, in the two cases being discussed, a12 is a pregnant woman and a22 a woman who is nursing a child. Both are submitted to complex prohibitions. A special prohibition rests perhaps on the name of individuals placed in certain situations.

[40] Whatever the case may be, these are the only names which we have been able to obtain and, regarding the prohibition which covers them, in the course of this report, we will not use them more than they are used in the daily life of the Nambikwara Indians. We shall now give some information concerning the individuals composing the group studied.

854 From this time on, the life of the Nambikwara infant goes on as we have described, and without there being much differentiation according to sex. These differences begin to appear only at the ap-
●881 proach of puberty. At this time, the girls adopt a completely new behavior. They allow themselves great liberties, speaking brutally to their entourage and [109] amusing themselves with obscene acts. The fact is that the ceremony of puberty, which coincides with mar-
[553] riage, marks a decided change in her life and it is also upon that occasion that she receives her name. The Nambikwara women marry
582 very soon after their first menstruation. The polygamy of the chiefs
[595] creates a permanent deficit of women, and the newly available wife is impatiently awaited. According to our informants, it is the young
584 girl who indicates to her parents which of her potential husbands she wishes to marry. She says that she "wishes to marry quickly" (ikĩndurige, b1); the term of dialect a1 for "to marry" being ouensaikititu, literally: "to make a husband," it seems that, as has been affirmed, the initiative belongs to the girl:

48. inka (ni) durednjẽn — durẽnje (b1)
"I wish to marry quickly" [says the girl]. "Marry," says the mother] (?)

Actually, it seems that the marriage is decided from infancy by an agreement between the parents. Farseeing parents must prepare far in advance the marriage of their son, for otherwise the latter risks not finding an available woman. Brothers-in-law have often indicated to us that their children were promised to one another.

881 At the time of puberty, the young girl is completely isolated for a period of from two to four months. She lives in a specially constructed shelter some distance from the village, and lives there alone, observing a series of alimentary and social taboos. During this period, her mother feeds her and takes care of her. The period of segration ended, songs and dances take place. Her shelter is torn down and "the mother takes back her child." Then the ceremony proper of marriage takes place. It is prepared by hunting and fishing, expeditions and is carried out amidst chants and dances:

49. ãrige ãũngnerage denano inŝira ãikira ãiknira tããta halonoo tatlĩkta ãindage hntimbãta ũrrige imãgãra imãgãra (b1)
Go get fish, the women arrive, arrive, to broil [the fish] in the square go out, sing, whistle, play the flute, play the flute.

585 The union of the husband and wife is pronounced by the chief who places in the mouth of each a large piece of fish. (1)

831

1. It has already been suggested (Kunike, "Der Fisch als Fruchtbarkeitssymbol bei den Waldindianern Südamerikas, Anthropos, VII 1912, p. 206-229) that the fish could be a sexual symbol among the South American Indians. Tastevin has vigorously criticized this hypothesis (Le poisson symbole de Fécondité ou de Fertilité chez les Indiens de l'Amérique du Sud, id., IX, 1914, p. 405-417). However, the Nambikwara ritual of marriage seems to confirm the first theory. Moreover, fish is directly treated as the symbol of sexual relations in the legend where Maire-Pochy makes a girl pregnant by [110] making her eat the fish which he himself had fished. As the origin of this Tupi story is certainly Andean (Kunike, loc. cit.; Métraux, p. 12-13; Ehrenreich, Ueber die Verbreitung und Wanderung der Mythen bei den Naturvölkern Südamerikas, Congrès international des Américanistes, Stuttgart, 1904, p. 663) we have there a supplementary piece of information concerning the affinity of the Nambikwara with the cultures of the North and West.

●881 [110] There is no puberty ceremony for the boys. This is replaced by a ritual of initiation which takes place toward the ninth or tenth year, apparently. It is composed of two essential operations, [553 304] the giving of a name, and the piercing of the lip and of the nasal septum to place some wood ornaments there. The first operation is done directly by the chief, the second by a companion whom he designates to this effect:

50. uetnoãdige iochãdige uilikade uelikãdeli'kinere nukeaiore judotige juroenie nikama jurojotige (b1)
When the boy is grown the chief, the chief gives him a name. A companion pierces his lip to put in the ornament. He [the chief] orders the hole [for the ornament] to be made.

SP17 Nambicuara SP17

tainship is not hereditary; the chief, when old or sick, designates his successor from the ablest men of the group. The chief's authority is slight; it depends wholly on the good will of the family heads.

Relations between neighboring bands are inspired both by fear and by the desire to exchange goods. Warfare, therefore, is closely connected with barter. Groups not acquainted with each other use ritual speech when they meet.

Before starting a war expedition, a divinatory rite is performed with special songs and dances. An arrow is hidden by the shaman, the outcome of the expedition being pressaged by its appearance the following day.

LIFE CYCLE

Childbirth.—After the delivery of a child, the placenta is buried in the bush and both parents are subjected to rigid prohibitions concerning food, the use of ornaments, and social contacts.

Puberty.—The initiation rite for young men consists of piercing their lips and nose and giving them their adult personal name. At her first menstruation, a girl is isolated for several months in a special shelter outside the village, where she is given ritual food by her mother. At the end of the rite, she takes a long bath in the river; this also constitutes the first step of the marriage ceremony.

Both cross-cousin and avuncular marriages (see p. 367), are often planned by parents for their infant children. Marriage is celebrated by festivals, banquets, and dances. The union is pronounced by the chief. Fish and fishing are important both before and during the ceremony.

Separation is frequent, the chief cause being that the man seeks a younger and prettier woman. There is no social sanction of adultery, except that the seducer is advised by his companion to go away for a while so as to avoid the husband's revenge. A murderer also flees vengeance.

Death.—Some groups of *Nambicuara* bury their dead in a circular pit, the corpse being placed in a crouching position. Others leave the corpse to decompose in an elongated ditch and later wash the bones in the river, put them in a basket, and bury them in the village, which is then abandoned. Weapons, implements, adornments, and other property of the deceased are destroyed, but his garden—if he owned one—is abandoned only for a few months. Later anybody may cultivate it.

ESTHETIC AND RECREATIONAL ACTIVITIES

Art.—Most *Nambicuara* groups are completely ignorant of drawing, although some groups decorate calabashes with dots and straight and sinuous lines. These are conventionalized reproductions of realistic designs found among other groups.

853 252 nail she opened the rat and threw the viscera and the rat on the coals. Within 15 minutes that rat was eaten, entrails and all, while Kaoro and I looked on in a state of horrified fascination. [862] Children thus begin by eating broiled meat and fish; pieces of sour, gritty manioc cake are given to them at a more advanced age.

PUBERTY

881 [304] When a boy reaches the age of 14 or 15 he has his upper lip and the septum of his nose pierced with a sharpened fibula of a monkey ("macaco-prego"). One man holds the boy's arms, another his head, while an older male relative performs the piercing. Small plugs of bamboo are then placed in the holes. The following night the shaman leads the band in singing and dancing. Food is prepared in large quantities and offerings are made to the ghosts who are believed to be present at the ceremony. [553] The boy is now given a name which he will keep throughout his life. If the boy's father is dead he will use his father's name. If the father is alive he will use the name of some dead member in his grandfather's generation. In this way names are passed from one generation to another. An important part of the boy's puberty ceremony is the ritual beating administered by the old men of the band. He is now permitted to take part in the singing and can be present when the sacred flutes are played in the flute hut. Although this creates an attitude of obedience to the older men, he still continues to be abusive toward the women of the band. His unmarried female cross cousins now begin to notice him and openly show their desire to go hunting with him.

The puberty ceremony for girls is much more elaborate. After a girl has her first menses her father builds a small hut in the center of the camp, in which the girl is secluded. She must remain in this hut day and night and is attended by her female relatives. [202] The chief then calls all members of the band together, even sending messengers to distant hunting parties. When the band is united the chief organizes a hunt in which all the men take part, and they must remain away from the camp until the moon is full. [251] While on the hunt they accumulate a great quantity of smoked meat. When the moon is full, the men send a messenger to the camp to whom the women give some of the

881 baked manioc and other food which they have been preparing. When the messenger leaves with the food it is a sign that the men will return to camp after sunset.

[302 314] Before the men arrive the women wash the girl and paint her with a mixture which includes latex from the rubber tree. A series of dots are painted on her face, breasts, abdomen, and thighs (pl. 6, *c* and *d*). When the men come in they dance in front of the girl's hut. She then comes out and is given a name and everyone tries to give her a necklace or some other object. During the night men and women join in the dance, holding hands and dancing in a circle, the dance steps being stamped out with the right foot in the direction in which the circle is moving. A special puberty song is also sung.

881 841 278 The Nambicuara tell of a strange medicine known only to the shamans which is given to girls during the puberty ceremony. It is a blue liquid which, when taken internally, stops menstrual bleeding for the remainder of the girl's life. The Waklítisu claim that they do not use it but that the other Eastern Nambicuara band do. The missionaries informed me that the Kitánrhu use this medicine, and the missionaries seemed to think that it was effective.

MARRIAGE

582 585 There is no special marriage ceremony, for when young people go through the puberty rites they are ready for marriage and a mate is selected for them by their parents. The young man, who 584 is to become the husband of a girl just out of 585 seclusion, goes to her parents and helps his future father-in-law build a small hut, and when it is finished the young man tells the girl to come out hunting with him. She takes a burden basket and they go off into the woods. In the afternoon the man builds a fire and tells the girl to prepare some food and honey. After the food has been eaten he tells the girl to come and lie beside him near the fire. She is supposed to resist and he takes a stick and threatens her. He then has sexual intercourse with her, and when they come back to camp that night they are accepted as a [587] married couple. When wives are acquired by inheriting the widow of a brother or by abduction from other bands, no ceremony is held.

PLATE I.—Nambikwara women.—a, Cassava-making fan. b, Nambikwara burden basket. c and d, Nambikwara girl with necklace and painted designs in preparation for puberty ceremony. (By courtesy of Rev. L. Bandeira.)

[p. 136 (I)]

231 principal spectacle for amusement. One hears such exclama-
521 tions as:

22. jakhũninde ɾteru ɰirokũnene (b1)
The flying ants! He (the monkey) catches them to eat!

They talk to the monkey while giving him fruits: ɰosɾ, "take!" and as the monkeys live very intimately with the dogs, they laugh hilariously seeing their goings on:

23. hõte ɰãinde miramiraina hõte ɰairɾdnjena (b1).
The monkey mounts the back of the dog! The monkey bites the dog!

and again:

24. kuɣarisena tãkɔlahẽ tãkela ãɣorĩsẽ kãdajena (b1).
It is balancing head down, head down it balances, it fell! (the monkey).

231 The children like to play at burning animals, and when
857 insects are involved, they are allowed to do so; but if they try
[865] to burn domestic animals by touching them surreptitiously with a piece of smoldering wood, they are severely reprimanded.

[74] THE GRANDPARENTS

603 We use the term in the classificatory sense, that is, the members of the third ascendant generation. In general, there are few—two in restricted group a1, five out of 75 persons in the enlarged group, three out of 31 in enlarged group b1 (in this estimate we do not include A1, a2 and a14, who can be classed as grandparents indirectly). This small number is
[165 explained, in part, by the very high mortality rate of the
• 887] Nambikwara, and partially also by the fact that aged persons, although participating in the nomadic life, do not move with the same mobility as the other members of the group, and are met more rarely. Whatever the case may be, the grandparents share the life of their descendants. The founding of a new family does not erase the ties between adults and their parents. We have underlined several examples while studying the phenomena
[592] of residence. Aged or widowed parents join the household of their son or daughter, either permanently or temporarily. Thus, in the absence of his son-in-law (A21) and of his wife (a18), A17 installs himself with his daughter (a22) and her baby (a23). She is the one who cooks manioc and cumaru nuts for the three.

542 treated with great affection. The men are jealous of their wives, and
[137] the women take pride in being faithful. In this respect they are quite unlike their neighbors, the Paresi women...

832 The couples are always petting each other, and no caress seems
302 sweeter and more tender to the lover than the woman's fingers running through his hair. This is easy to understand, for the Nambicuara head swarms with vermin...

[Fig. 38]

585 According to reports of the soldier Gouveia, marriage is a simple ceremony. The man asks the father of his beloved for consent to the union. If the father agrees, he gives the bridegroom a bow and a sheaf of arrows, telling him that with these weapons he must support the family he is about to form. That is all.

851 To show that a boy is the son of a certain man, they use in
201 their innocence an expressive gesture: they join the thumb and index finger of the left hand, in the shape of a ring, around the right extended index finger. Then they tap the child and father on the shoulder, saying "Uétñ!" (son).

●888 They show great respect for old people and spare them all possible effort. When we returned from the village on the Urutau to the post on the Juina, they had us carry [258] on the bow of our saddles the baskets of two old men from the group that accompanied us in search of gifts. The young men and the women all carried their own atiçú and did not ask for help.

771 As to their religion, we know only that it is fetishistic. We know nothing of its cult or system, and even less of its dogma. [Fig. 33]

821 The northern groups seem to be tending toward astrolatry. Once
[771] when I had threatened the moon and the stars with an arrow, poised ready on a strung bow, several Tagnani rose abruptly and halted my gesture, speaking very excitedly, scolding me, and taking the weapon away from me as if it were a sacrilege.

The Cocozu and Anunze threaten the storm with their weapons, waving their arms in all directions and cursing the rain in loud yells.

Sometimes, instead, the women climb on a termite nest where they let out puffs of smoke and throw ashes into the air to frighten the storm.

764 We do not know anything as yet about their funeral rites. It has been ascertained, however, that they do not cremate their dead and do not eat them. They bury them directly [259] in the ground--
the Cocozu in circular pits, the Tagnani in elongated graves.
